## FOREWORD

This study follows a previous report distributed in March 2001 that covered the period from 1<sup>st</sup> October 2000 to 31<sup>st</sup> January 2001. The Swiss Agency for Development and Cooperation (SDC) felt it was timely and appropriate to run a second poll in the West Bank and the Gaza Strip to better grasp the perceptions of the Palestinian population concerning the role and the impact of international and local aid during the ongoing crisis. Therefore, this study covers the period from 1<sup>st</sup> February to mid-June 2001.

SDC again contracted the Graduate Institute of Development Studies (IUED) of the University of Geneva, Switzerland, to conduct the study. The IUED assigned a small team of experts for the project, composed of Dr. Riccardo Bocco (professor of political sociology and research director at IUED), Mr. Matthias Brunner (lecturer in political science methodology at the Department of Political Science of the University of Geneva and director of CyberProjects) and Mr. Jamil Rabah (poll specialist and consultant for the SDC Gaza and West Bank Office).

During the month of April the team worked on the elaboration of the questionnaire for the poll and benefited from exchanges and discussions with Prof. Elia Zureik (sociologist, Queen's University, Canada), Mr. Jalal Hussein (researcher at the Department of Refugee Affairs, PLO, Ramallah) and Prof. Rémy Leveau (political scientist, Institut d'Etudes Politiques, Paris).

In June 2001, the JMCC (Jerusalem Media & Communication Centre) was contracted to run the poll, under the supervision of Dr. Ghassan Khatib and Ms. Manal Warrad. The draft of the questionnaire was also presented to a number of concerned parties and pre-tested for validity by the JMCC.

The results of the poll were ready by late June and the authors of this report met in Jerusalem from 21 to 30 June to examine the breakdown of the data and its tabulation. During the same week, the authors of the report also interviewed a number of concerned actors in Jerusalem and the West Bank to get a preliminary feedback on the poll's findings.<sup>1</sup>

The data were coded and entered by the JMCC, while the analysis and weighting of the data is the sole responsibility of the authors of the report. Dr. Isabelle Daneels kindly edited the final text of the report.

Geneva, July 2001

**EXECUTIVE SUMMARY (ATTACHED)**

## INTRODUCTION

The period under scrutiny through the poll conducted in June coincides with some major changes in the international and local context. Actually, between the end of January and the beginning of February 2001, two major events have impacted the course of the present crisis, the possibilities for mediation and the hopes for reducing the violence.

On the one hand, the election of a new President in the United States has seemingly marked a different trend in the American Administration towards the Middle East Peace Process. Mr. Bush's stand towards the Intifada has been characterized by a first period of "absence" in the efforts to mediate between the Palestinian and Israeli leaderships and signaled a clear departure from the Clinton administration. The US representative at the UN has also vetoed the Security Council decision to send an international peacekeeping or protection force for the Palestinian population and, only more recently, the USA have taken a more pro-active approach.

On the other hand, the election of Mr. Sharon as the new Israeli Prime Minister at the head of a "national unity" government has not contributed in softening the position of the parties in conflict. Israeli settlements have continued to expand - especially in the West Bank and around East Jerusalem - and the tension between the Palestinians and the settlers increased. Furthermore the Israeli Defence Forces have deployed checkpoints all over the West Bank and the Gaza Strip which are obstructing mobility. In some locations, earth walls and trenches are built around villages. This contributes to keep pressure on the Palestinian civilian population at different levels (see in the annexes the checkpoints' maps for West Bank and Gaza). The situation has important practical consequences for services' delivery and aid distribution to the civilian population during the crisis.

Eight months after the beginning of the Intifada, the promises and perspectives of continuing the "Oslo Process" seem far away, not to say vanished. As Hammami and Hillal (2001) have pointed out: "The current Likud discourse is like an artifact from another age. Since Oslo, the word "terrorist" has been reserved for Hamas and Islamic Jihad. Now it refers to any form of Palestinian resistance to occupation, and includes the PLO's mainstream faction Al-Fatah as well as Force 17, Arafat's presidential guard". Though Mr. Sharon has been repeatedly stating that talks could resume once violence is quelled and security cooperation properly reinstated, the Israeli Prime Minister doesn't seem to be willing to go back to the Oslo framework. The negotiations on the implementation of the Mitchell Report's recommendations are suspended, and the Egyptian-Jordanian proposal (based on the Sharm el-Sheikh ceasefire deal brokered by Clinton in October 2000) has not been accepted by Israel.

The very continuation of the Intifada is progressively bringing the Palestinian Authority (PA) and the PLO to a crossroads. The PA is caught between strong economic, diplomatic and military pressure to end the militant forms of the uprising, on the one hand, and strong popular support of the Intifada, on the other hand. In addition, the PA faces difficulties in gaining substantive and concrete advantages from the present crisis.

In fact, the finances of the PA are partially “hostage” in the hands of the Israeli government : since the Autumn 2000, customs and VAT revenues (which make up almost two-thirds of the PA’s budget) have not been transferred to the Palestinians. Furthermore, due to the crisis, the Israeli labor market has almost completely dried up, and the potential for increased government revenue through the taxation of the private sector has strongly decreased. The greatest part of emergency aid from international donors has mainly been channeled through UN Agencies (UNRWA and UNDP in particular). Since March 2001, the European Union and some Arab States have stepped in with monthly loans to the PA to compensate for the lack of transfer of customs and VAT revenues<sup>2</sup>. This has allowed the PA to ensure the survival of its formal institutions.<sup>3</sup>

On a more internal level of analysis, many observers have also stressed the ongoing changes in Palestinian society and politics. In comparing the first and the present Intifada, Hammami and Tamari (2000) have pointed out that : “Ten years ago the Palestinians had a strong civil society, a colonial State and an amorphous internal leadership, the Unified National Leadership of the Uprising. The PLO directed, or attempted to direct, the movement by remote control from Tunis. Today in Palestine there is a virtual state apparatus *in situ*, headed by the relocated and expanded PLO bureaucracy, with a substantial and armed security apparatus and an elected parliament. The PA presides over a “peace process” which, after seven years, has left them and the population they rule penned into disconnected fragments of the Occupied Territories, encircled by ever growing settlements. Yet these new actors seem paralyzed at a critical moment of Palestinian history”.<sup>4</sup> In several cases, the PA leadership’s performance has not met the expectations of larger Palestinian constituencies. Popular criticism has been mounting and at the March PLC meeting, Arafat has addressed the importance of internal political and institutional reform and stressed the commitment to the rule of law.<sup>5</sup>

---

<sup>2</sup> This was the result of an informal Joint Liaison Committee meeting in Stockholm during the Swedish presidency of the European Union, and where the PLO/PA and Israel were not present.

<sup>3</sup> For further analysis of the economic situation, see Farsakh (2000) and Hammami & Hillal (2001).

<sup>4</sup> For an analysis of the fallbacks of the Peace process, Camp David II and the beginning of the Intifada, see also Bishara (2001).

<sup>5</sup> Hammami and Hillal (2001) offer also a qualified insight into Palestinian politics since the beginning of the Intifada.

Although it is not the purpose of this introduction to embark on a detailed political analysis, the authors thought it was useful to put the data of this study into context. Therefore, before entering into the proper scrutiny of the survey conducted for this study, a synthesis of results drawn from other polls<sup>6</sup> recently conducted in the West Bank and the Gaza Strip will be provided in order to allow for further insight into Palestinian perceptions and attitudes towards more socio-political issues.

According to the JMCC public opinions polls (2001a, 2001b), over the past six months, popular support for the continuation of the Intifada has increased to 80%, compared to 70% in December 2000. In April 2001, more than 62% of the Palestinian people supported the continuation of both forms of the Intifada (popular and armed struggle), while in June this double form of support has decreased to 54%, in favor of a slight increase for support to the continuation of popular forms of resistance (20% in June against 14% two months before). The change is more marked in the West Bank than in the Gaza Strip.

In June 2001, a large number of Palestinians (46%) thought that the aim of this Intifada is to end the Israeli military occupation, following UN Security Council resolution 242 and the establishment of an independent Palestinian State; 41% said that the aim of the present Intifada is the total liberation of Palestine, while only 9% considered it as a tactic for improving the negotiations' track conditions (JMCC 2001b).

Under the current circumstances, more than 70% of Palestinian people consider military operations against Israeli targets as a suitable response. In June, support for suicide bombings increased to 69%, compared to 66% in April (compared to only 26% in March 1999 !). Among Gaza residents, the percentage of support (78%) is higher than in the West Bank (63%). According to the most recent poll of the University of Birzeit (2001), 60% of the educated people surveyed opposed providing children with any military training during summer camps, while 68% of the least educated respondents support such a training.

There is a continuous and steady decrease in Palestinian popular support for the Oslo Agreements. While in June 2000 more than 57% supported the Oslo framework, in April 2001 the percentage has fallen to 40% and in June it went further down to a mere 38%. It seems that middle class and middle aged Palestinians are increasingly viewing the various issues at stake with skepticism. Their attitudes are becoming comparable to those of younger Palestinians who hold "hard-line" positions, especially in relation to the peace process and the PNA.

---

<sup>6</sup> We refer here to two polls conducted by the JMCC (2001a & 2001b) and run respectively on 5-12 April and 14-17 June, as well as to another poll conducted by the Development Studies Program of Bir Zeit University on May 31 - June 3, 2001 (Bir Zeit University 2001). All these polls covered an average of 1200 residents in the West Bank (including East Jerusalem) and the Gaza Strip.

Furthermore, a sweeping Palestinian majority (95% in April and 96% in June 2001) considers the United States biased in favor of Israel in its functions as peace process sponsor; the dissatisfaction with Arab solidarity towards the current Intifada has reached almost 85% of the population in June 2001, compared to 61% in December 2000 (JMCC 2001a, 2001b). According to the University of Bir Zeit's poll of early June 2001, 93% of the people surveyed evaluate the role played by the US with respect to the present Intifada as negative. This compares to 75% of negative ratings for both the European Union and the United Nations, followed by the negative perception of the role of Arab countries (62%) and Islamic countries (42%).

However, the Palestinian people seem to have some kind of hope in the possibility of a peace process since in April only 30% (and in June 27%) believed that the peace process is completely dead with no chance of resuming negotiations. A majority of Palestinians (44% in April and 50% in June) stated that the peace process is experiencing difficult circumstances with an unclear future. Concerning the question whether the PA should accept the Mitchell Report or not, the JMCC's poll (2001b) shows that a majority of people (53%) oppose it; among those who support it, more than 48% are West Bankers and only 36% are Gaza residents<sup>7</sup>.

As for support to factions and politicians among the Palestinian population, Fatah kept the same trust (around 35%) in April and June 2001, witnessing a slight increase in comparison with the scores obtained in December 2000 (32%). Support for the Islamic Resistance Movement Hamas remained at the same level (around 18%) and has increased since the beginning of the current Intifada (it was 12% in June 2000).

In June 2001, Yasser Arafat remained the most trusted (28%) of Palestinian political personalities, although his score has decreased compared to the April results (32%). Concerning the debate in international circles as to whether the Palestinian President is in control of the internal situation, 51% of the surveyed population said that Chairman Arafat is in control up to a certain degree (JMCC 2001b).

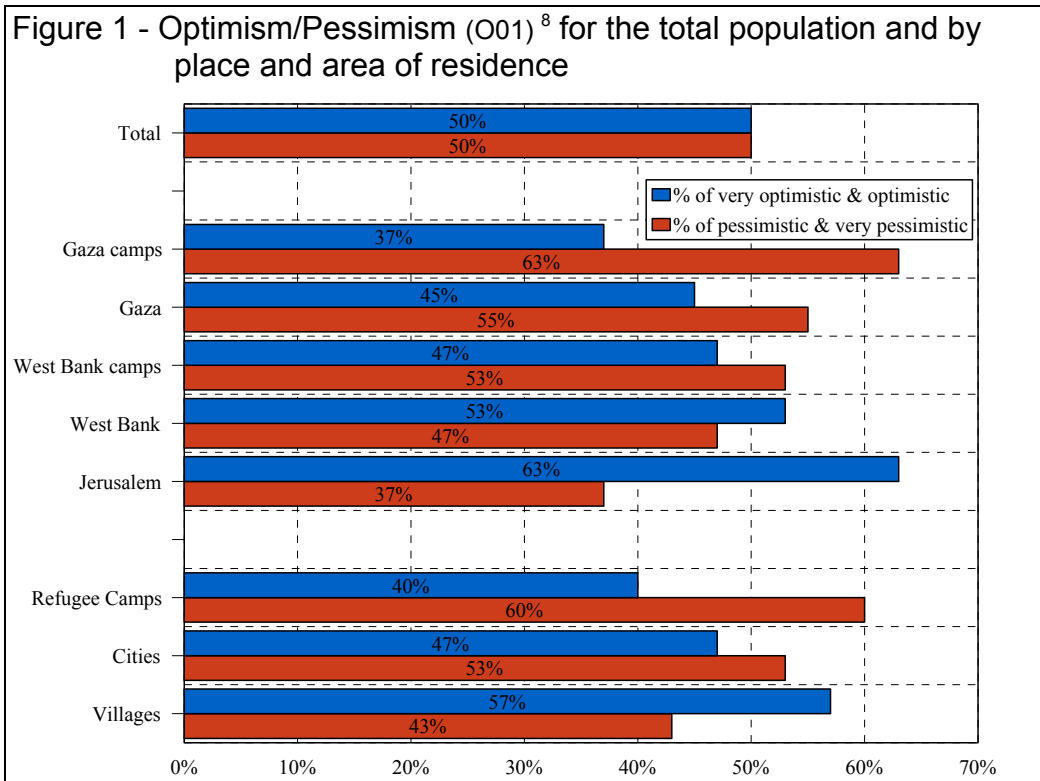

Finally, according to the University of Bir Zeit poll (2001), pessimism is on the rise and the refugee camps inhabitants are the least optimistic. The youngest (16-17 years old) and the oldest (over 42) respondents and the less educated ones are the most optimistic. Government civil servants are the most optimistic (44%), compared to private sector employees (39%), and NGOs employees (29%). According to the type of work, the most optimistic are the professionals, the retired and the

---

<sup>7</sup> See also: "The 'Mitchell Process' and the Failure to Address Root Causes of the Palestinian-Israeli Conflict" in: *Al-Majdal* (quarterly newsletter published by BADIL Resource Centre for Palestinian Residency and Refugee Rights, Bethlehem), issue no. 10, June 2001, pp. 3-5.

farmers, while the unemployed, the monthly salaried employees and the merchants are the least optimistic.

The results of the poll conducted for this study show that about 50% of the respondents are generally optimistic. As indicated in figure 1 below, West Bankers are generally more optimistic about the future than Gazans, while refugee camp inhabitants seem to be the most pessimistic. City dwellers are also less optimistic than village residents.

<sup>8</sup> "O01" relates to the table presented at the beginning of Annex II which gives the question numbers in the January and in the June poll. The same logic will be used throughout this report.

## OBJECTIVES AND METHODOLOGY

The questionnaire for the poll (see Annex 3 for the Arabic version and Annex 4 for the English version) was elaborated in a way that could offer data on Palestinians in the West Bank and the Gaza Strip on five main topics:

- A general description of the mobility and security conditions of the civilian population the impact of the crisis on Palestinian families in terms of material losses (property damaged, trees uprooted, business), as well as human suffering and losses (children, injured and martyrs<sup>9</sup>); displacement and forced change of residence, access to health care and to education.

- A portrait of the socio-economic conditions for assessing change in the employment situation (including the place of work, work occupation and the effects of the Intifada on jobs); the households demography and the job market (including the number of people living in the household, the people employed, and the number of members who lost their jobs); the perception of the evolution of the price of some basic commodities and the households' financial situation; finally, the coping strategies of the Palestinian population (including the evolution of the households' expenses; the nature of the expenses that were cut; the strategies for sustaining the hardship; the coping mechanisms for the future; the perception of Israeli versus Palestinian products; and the coping strategies pertaining to work).

- The assistance delivered according to type, value and source, as well as the specificity of the employment generation programs.

- The impact of the assistance delivered for measuring the perceptions of the Palestinians. This part includes an analysis of the individual satisfaction with the provided aid in five main areas: health, food, employment, education, infrastructure, as well as the visibility, importance and effectiveness of the assistance delivered.

- The UNRWA's strategies during the past months, the type of assistance provided by the UN Agency (in particular food aid, employment generation and financial assistance), the patterns of aid distribution and its effectiveness, as well as the satisfaction of its beneficiaries.

A representative sample of 1270 Palestinians over the age of 18 were interviewed face-to-face between the 19<sup>th</sup> and 23<sup>rd</sup> of June 2001. In the West Bank (including East Jerusalem) 832 Palestinians were interviewed, and 438 were interviewed in the Gaza Strip.

---

<sup>9</sup> The word "martyrs" has been officially adopted by the PLO/PA administration to indicate the people killed during the current Intifada.

Sixty-three sampling units were randomly selected from both the West Bank (including East Jerusalem) and the Gaza Strip. Cities and regions were stratified according to population size. Sampling units in towns, villages and refugee camps were selected according to simple random sampling from within a list that includes all Palestinian population concentrations. The random selection was carried out proportionally to the population size of these concentrations according to the Palestinian Central Bureau of Statistics (PCBS) : each concentration was divided into units comprising one thousand people each. If a population concentration has a population of 10,000, then it is assigned ten units, accordingly it has ten chances of being randomly selected.

Sixty-two interviewers were then assigned to the primary sampling units. Each of the interviewers was instructed to interview not more than twenty respondents. Households were randomly selected according to a pre-defined route. The respondent inside the household was selected with the help of a Kish table (see first page of the questionnaire)<sup>10</sup>. In case a respondent was not available during the interviewers' visits, an appointment was made for a second visit.

West Bank refugee camps were over-sampled by 70 people in order to ensure sufficient cases for a deeper analysis of this group. The results presented hereafter are weighted to be representative of the whole Palestinian population.<sup>11</sup>

All the results presented in the remainder of this report will be analysed in terms of:

- ▶ **Place of residence:** The West Bank and the Gaza Strip (inside and outside refugee camps) and East Jerusalem.
- ▶ **Refugee Status:** Refugees and non-refugees.
- ▶ **Area of residence:** Cities, villages and camps.
- ▶ **Gender:** men and women.
- ▶ **Age groups:** 18-25 years / 26-35 years / 36-45 years / 46-60 years / more than 60 years.

The first two variables could have been combined into one category. In that case, however, some subgroups would have become too small for analysis (for example: non-refugees in camps). As such, it was thought

---

<sup>10</sup> In Europe the random selection of a household member is generally carried out with the "birthday technique" (interview the person who had her birthday most recently). In Palestine, mainly because of the large household size, this information may be hard to get, this is why Kish Tables are used.

<sup>11</sup> According to random sampling, 62 persons in West Bank refugee camps should have been interviewed. The sample of this survey included 132 West Bank camp residents. Therefore, for the results to be representative, less weight (0.497) had to be given to the surveyed West Bank camp residents, while more weight was given to the remaining interviewees (1.058). The only graphs and tables that are not weighted are those that include the category "West Bank refugee camp" as they are representative *per se*.

more appropriate to analyse the variables of “place of residence” and “refugee status” separately.

Results were systematically tested for statistical significance at a 95% confidence level. If no differentiation is shown or mentioned, this means that there was none.

In order to indicate the extent to which the data collected for this report are representative, it is important to compare them with some available official figures. This comparison has been made in full detail in the first report (Bocco, Brunner & Rabah, 2001). The report is available on the website of the IUED (the Graduate Institute of Development Studies of the University of Geneva : [www.iued.unige.ch](http://www.iued.unige.ch)). As the whole sampling and interview procedure remained the same, only some basic comparison will be provided hereafter.

Figure 2, below, illustrates the geographical distribution of the sample of this study according to **place of residence**. PCBS estimated the proportion of West Bank Palestinians, including those living in East Jerusalem, at nearly 64%. In the sample of this study, West Bank and East Jerusalem respondents represent 63.5%.<sup>12</sup>

Taking a closer look at the **areas of residence**, figure 3, below, shows that approximately half of the respondents live in urban settings, one fifth in villages and one third in camps.

<sup>12</sup> 132 people were interviewed in the West Bank refugee camps. As explained in note 3, the results presented here are weighted to be representative.

Figure 3 - Area of residence (O60)

In the survey for this report, 628 **women**<sup>13</sup> were interviewed. In relation to their marital status, 25.1% are single, 66.7% are married, 2.9% are divorced and 1.3% are widowers. They account for 49.5% of the sample which is the exact figure according to PCBS projections for the year 2000.

Figure 4 - Age groups (O55)

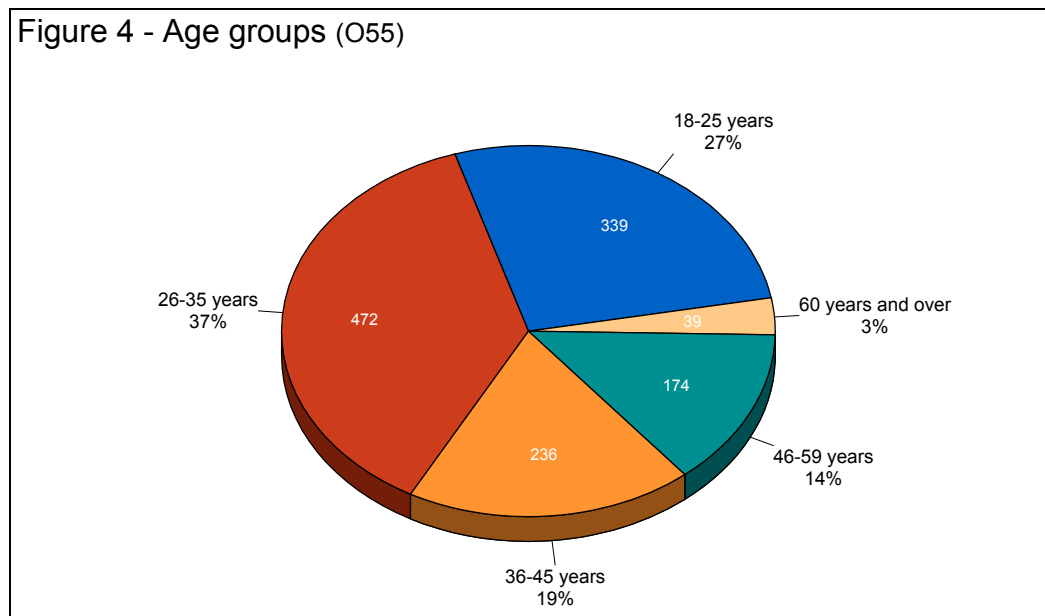

Figure 4, above, illustrates the relatively young **age structure** of the Palestinian population surveyed. In fact, people over the age of 60 represent a mere 3% of the surveyed population aged 18 and above.

Concerning educational level, 4% of the sample had no education, 8.5% went until elementary school, 19.3% until preparatory, 34.3% until

<sup>13</sup> The gender of the respondents is specified in the answers to question O61.

secondary, 23.4% had some college education, and 10.5% finished their college education.

Finally, whenever possible, consideration was given to data generated from studies and surveys that were made available recently and that cover the same period of time on some issues addressed in this report. also It was thought appropriate to introduce comparisons between the data presented in the first report of March 2001 and those of this study, to show the evolution of the situation.

## PART ONE : MOBILITY AND SECURITY CONDITIONS OF THE CIVILIAN POPULATION

The first part of this report provides a general description of the circumstances the Palestinian population were confronted with in the period between early February and mid-June 2001.

After an overview of the mobility issue, the second section of part one will concentrate on the consequences of the “quasi-war” situation with regard to the displacement and forced change of residence, as well as the access to health care for the Palestinian population.

The number of Palestinians injured or martyred and the damages inflicted on private and public property will be detailed in section three.

Finally, the last section of this part will provide pointers that may contribute in evaluating the impact of the second Intifada on children, including issues related to access to education.

### 1.1 - Mobility

In January, 79% of the people interviewed said that mobility was a serious problem. In the June sample this proportion raised to 84%.

If, as in figure 5, this result is broken by place of residence, one can see that this increase is correlated with the place of residence. “Only” 64% of Jerusalem respondents said that mobility was a serious problem in January while this proportion went up to 79% in June. To a lesser extent, one should note a 10% increase in West Bank refugee camps and 8% in Gaza outside camps.

While in January women seemed less affected (75%) than men (82%), the June survey shows the same proportion of men and women thinking that mobility was a serious problem.

Annex V contains a map with the different checkpoints set up by the Israeli military inside the West Bank which largely account for restricting the mobility of persons and goods.

## 1.2 - Security conditions of the civilian population

According to PCBS (2001b)<sup>14</sup>, during the first 7 months of the Intifada around 330'000 Palestinians have been exposed to Israeli assaults and measures (including: bullets, shells splinters, tear gas, harassment by Israeli soldiers and settlers, detention).

The security conditions of the civilian population have further deteriorated at different levels during the period from early February to early June 2001. As it has been underlined by the ICRC (2001) : "Breaches of International Humanitarian Law by the occupying power, such as the policy of isolating whole villages for an extended period and other measures of collective punishment, and administrative harassment, occur on a daily basis and have a serious impact on the civilian population".

<sup>14</sup> The PCBS survey was conducted between mid-April and mid-May 2001. It included almost 3400 households, approximately 2/3 in the West Bank and 1/3 in the Gaza Strip.

## Displacement and forced change of residence

During the first 7 months of the Intifada, the PCBS (2001b) has estimated that about 56'000 Palestinians, i.e. 7600 households had to change their place of residence. For most of them (around 33'500 people, i.e. 60%), the main reason to move was the proximity of their residence to military checkpoints or to Israeli settlements, which have constituted so far the main place of friction during the current Intifada. However, this reason accounts for almost 77% of surveyed cases of forced displacement among Gaza inhabitants and slightly less than 40% of cases among West Bank residents. Among the latter, work reasons or study account for 13% of cases respectively.

More than half of the Palestinians that were forced to move their residence in the West Bank and the Gaza Strip are children.

Concerning the type of change, 70% of people (i.e. around 38'700 persons) considered their move as temporary, 18% (i.e. 10'300) as permanent, and 12% (i.e. 7000) did not know whether the change is temporary or will be lasting. Here again there are some marked regional differences. While 54% of the people of the West Bank who have moved consider their change of residence as temporary, it is the case for more than 82% of the surveyed people in the Gaza Strip. There is more uncertainty in the West Bank (24%) than in the Gaza Strip (less than 3%) among the people who moved and do not know about their fate in the future (whether they will come back to their former residence or not).

## Health Care

In a report prepared at the end of April, the ICRC (2001)<sup>15</sup> has clearly summarized the critical situation: "The imposition of restrictions on the movement of people, goods and services by the Israeli authorities has rendered access to timely and adequate medical services difficult for the resident population in the territories. Strict closures imposed on villages and towns seriously limit the movement of ambulances. Checkpoints and physical barriers slow down emergency missions, resulting in increased complications, and in a few cases death, for medical patients. Ambulances are harassed and in many cases even shot at. Transportation of medical goods from central stores to health institutions is also hampered, and access of medical staff to their workplace has become extremely difficult. Some vaccination programmes have had to be cancelled as the vaccines could not be transferred. Chronically ill patients have increased difficulty in reaching the reference hospitals. The situation for the most vulnerable, such as the elderly, the mentally handicapped and social cases, has further

---

<sup>15</sup> An important report published by B'Tselem at the end of June 2001 on the medical implications of Israel's siege policy, offers a parallel picture of the situation to that given by the ICRC.

deteriorated, as resources have been primarily allocated to the emergency needs of the injured”.

According to PCBS (2001b), about 38% of the surveyed households reported that the main reason for not being able to access health services is due to the unavailability of medication or the impossibility to afford the cost of treatments; 23% said that the main reason was the inability to reach the place of health services; and 18% reported that medical staff was not able to reach the place of health services or was lacking medical equipments.

Furthermore, according to the HDIP report of May 2001: “Palestinian pharmaceutical companies are facing problems in the production and marketing of pharmaceutical products. Their problem stems from Israeli policies of closures, which prohibit workers from getting to their place of work and hinder the distribution of products to different areas. Israeli authorities have also blocked the entry of raw materials needed by the pharmaceutical industry in Palestinian areas. (...) Palestinian pharmaceutical company sales during the Intifada have dropped by 40% and currently companies function at 25% of their full productive capacity”.

Concerning maternal health care, according to PCBS (2001b) the percentage of pregnant women (15-49 years) who did not receive antenatal care, increased by 4.5 times due to Israeli measures. In the Gaza Strip, the percentage of women who did not benefit from antenatal care was more than the double of that in the West Bank.

HDIP has also recorded the important number of attacks since the beginning of the current Intifada against the medical personnel (2 doctors and one ambulance driver have been killed; 143 medical aids and nurses have been injured); against ambulances (59 vehicles, i.e. 73% of the PRCS fleet, have been damaged during 138 different attacks); and against hospitals in Jerusalem, Bethlehem, Hebron, Beit Jala and Bethlehem<sup>16</sup>.

Finally, the graphics provided by the Palestinian Red Crescent Society (PRCS)<sup>17</sup> allow for monitoring the evolution of the attacks on Emergency Medical Services (EMS) from the beginning of the Intifada until early August 2001 (see figure 6 below). This means that in the period under scrutiny in this report, PCRS ambulances have suffered an average of an attack per week. Figure 7 below, shows the work accomplished by the EMS in the Palestinian Territories from September 2000 until mid-May 2001 in terms of injuries treated in field hospitals versus patients transported to emergency rooms. Exception made for Jerusalem, in the West Bank, the majority of injuries were treated in field hospitals.

### 1.3 - Martyrs, injuries and damage to properties

As in January, the June respondents were asked to state the damages caused by the current Intifada on their family and properties. Figure 8 compares those results across the two surveys.

Damages on physical persons seem to have diminished between January and June. The proportion of martyrs went down by 4% and the proportion of injured by a striking 11%.

In the February report, the proportion of reported deaths was proportionally high compared to official figures. At that time, the authors put forward the hypothesis that the news of deaths is more striking than that of injuries and therefore spreads more quickly across the extended family. In the poll conducted for this report, respondents were asked to specify their relationship with the injured or the martyred. It appeared that the proportion of the martyrs that are members of an extended family is substantially higher (26%) than the same proportion among injured people (18%). This result confirms the hypothesis made in the February report.

The negative impact on property and business reported by the surveyed population stayed constant between January and June, but the proportion of the sample who reported to have suffered from trees uprooting rose by 5%.

According to the results of the survey conducted for this report, the crisis affected Palestinians in the Gaza Strip and in the West Bank differently. As shown in table 1, the Gaza respondents suffered more than West Bank respondents in terms of martyrs, injured, property damage and having trees uprooted in their properties.

However, a higher number of West Bank interviewees than Gaza Strip interviewees reported that their business had suffered since the outbreak of the Intifada.

Table 1 - Injuries and damages (O34A-E) by place of residence, January-June

Type of injury	West Bank	WB camps	Jerusalem	Gaza	Gaza camps
<i>January</i>					
Relative martyred	11%	20%	5%	27%	31%
Relative injured	28%	48%	23%	62%	44%
Family property damaged	17%	15%	11%	23%	17%
Family trees uprooted	18%	2%	7%	28%	10%
Family business suffered	56%	37%	41%	46%	34%
<i>June</i>					
Relative martyred	8%	19%	5%	18%	30%
Relative injured	22%	34%	22%	41%	32%
Family property damaged	19%	27%	3%	18%	16%
Family trees uprooted	20%	18%	0%	28%	31%
Family business suffered	44%	55%	33%	54%	58%

A closer look at the evolution of those figures between January and June yields a few interesting results:

- ▶ The distribution of *martyrs* varies considerably by place of residence: In January approximately 30% of martyrs were reported in the Gaza Strip, 20% in West Bank refugee camps, 10% in the West Bank outside camps and 5% in Jerusalem. The decrease of the martyrs proportion is mainly found in Gaza outside camps where it reached almost 10% (27-18%). Everywhere else, the decline was smaller than 3%.
- ▶ The proportion of *injured people* is highest in Gaza outside camps (41%), and in refugee camps in Gaza and the West Bank (around 33%). West Bank outside refugee camps and Jerusalem present lower figures (22%). The decline of the overall figure here is proportional to the January level.
- ▶ *Property damage* has risen strikingly in West Bank refugee camps (15-27%) which now becomes the most affected place. Gaza which was the most stricken place in January underwent a significant decrease (23-18%).

► Uprooted trees concerned refugee camp dwellers much less in January. In June this proportion tripled in Gaza refugee camps (10-30%) and rose by 16% in the West Bank camps (2-18%).

► The same phenomenon occurred with the impact on *business*: camps, which were less hit in January underwent a very sharp increase in June (34-58% in Gaza, 37-55% in the West Bank).

Figure 9, below, details the impact by *refugee status*. It shows that martyrs and people injured are more common among refugees as well as business damages. Concerning this last type of damage it is interesting to note that the impact is the opposite in June compared to January. In January, among refugees the proportion was 46% and among non-refugees it was 51%; it is nearly exactly the reverse in June.

Property damages used to be more or less the same among refugees than non-refugees: ~18% in January. The proportion of property damages decreased slightly among refugees (-2% since January), while it increased slightly among non-refugees (+2%).

The proportion of Palestinians reporting damage from uprooted trees to their properties went up in both groups but it appears more important among non-refugees.

Incidentally, perceptions on the impact of the crisis among respondents do not differ seriously according to gender. Furthermore, when analyzing the impact of the crisis according to the various age groups surveyed, it seemed that the youngest and eldest respondents were less aware of the general situation regarding casualties and inflicted damages than the other respondents.

The data contained in other reports complement the perceptions expressed by the Palestinians throughout this survey.

Concerning damage to properties, HDIP's report of early August 2001<sup>18</sup> mentions serious damages due to bombing to more than 4000 buildings, 773 houses (328 completely destroyed), 30 mosques, 12 churches, 108 wells and several cemeteries. More than 25'000 olive trees and fruit trees have been uprooted, 42'000 dunums<sup>19</sup> of land have been bulldozed (78% of which were agricultural land).

The special issue of Palestinian Human Rights Monitor published in February by PHRMG (2001a) provides full details of Israeli bombardments and destruction of Palestinian civilian homes and infrastructure, case-studies from the West Bank and the Gaza Strip and the types of weapons and ammunitions used for the destruction. It also provides an overview of the destruction of commercial and agricultural property.

In a special issue published in April, PHRMG (2001b) also offers important data, testimonies and analysis on settlers' violence during the current Intifada, in particular on the types of attacks against the Palestinian population (including killings, shootings, beatings and stoning).

A number of graphics produced by the PRCS allow for a precise analysis of the situation of injured and martyrs<sup>20</sup>.

Figure 10 below shows that the peak of injuries and death occurred during the months of October and November 2000, with 5900 people injured and 244 killed. Between the months under review in this report (February-mid-June 2001), the average number of deaths per month was 40, while the number of injured per month averaged at a little less than 800 people.

Concerning the places where people were injured, it is interesting to note that, according to the PCBS survey (2001b), slightly less than 80% of the injuries occurred at the same locality of residence of the victims.

---

<sup>18</sup> This report synthesizes data from October 28<sup>th</sup>, 2000, up to July 31<sup>st</sup>, 2001. See: <http://www.solidarite-palestine.org/doc030/html>

<sup>19</sup> One dunum equals 1000 square meters.

<sup>20</sup> See: <http://www.PalestineRCS.org>

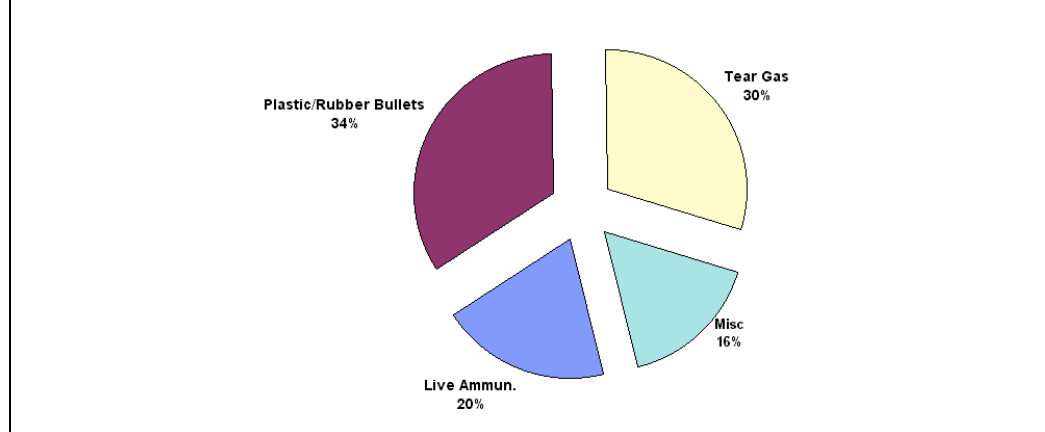

Figure 10 - Monthly deaths and injuries, 29 Sept. 2000 - 31 July 2001

Regarding the types of injuries, Figure 11, below, shows that rubber-coated bullets are the main agent, followed by tear gas and live ammunitions<sup>21</sup>.

Figure 11 - Injuries by type, 29 Sept. 2000 - 6 Aug. 2001, Total 15'059

<sup>21</sup> The PRCS' website contains also two articles that explain in full detail the effects of the ammunitions used by the Israeli army on the Palestinian injured population. As an example we will say that, qualitatively speaking, each high velocity bullet injury creates a status of medical emergency, since such an injury affects multiple organs and creates serious problems in terms of case management. In the long term, such injuries become an enormous burden in rehabilitating the patients.

However, when looking at the nature of injuries over time, one can notice (Figure 12 below) that the use of live ammunitions by the Israeli army during the period of February-May 2001 has kept constant; the use of tear gas and rubber-coated bullets has been more pronounced in February and March than in April and May, while during the latter months, most injuries have been caused by shrapnel and a combination of other ammunitions.

Finally, examining the regional distribution of injuries and deaths since the beginning of the Intifada, figures 13 and 14, below, offer important data.

Until mid-June 2001, the PRCS has recorded 14'461 people injured, of which 3813 in the Gaza Strip, 685 in Jerusalem and 9958 in the West Bank. The district of Ramallah has paid the heaviest toll in the West Bank with almost 3'500 injured, followed by Jenin, Hebron, Nablus, Qalqiliya, Bethlehem, Tulkarem, Jericho and Salfit.

Concerning the number of deaths, the PRCS has recorded 521 deaths during the same time span. The Gaza Strip accounts for 204 cases, Jerusalem for 17 and the West Bank for 295. In the West Bank, the Nablus district has seen the highest number of martyrs, followed by Ramallah, Hebron, Jenin, Bethlehem, Tulkarem, Qalqiliya, Jericho and Salfit.

Figure 13 - Injuries by region, 29 Sept. 2000 - 17 June 2001, Total 14'461  
(5 of which were not assigned a region)

Figure 14 - Total deaths by region, 29 Sept. 2000 - 17 June 2001, Total 521  
(5 of which were not assigned a region)

## 1.4 - Impact on Children

The crisis is harshly affecting the Palestinian children. In the February report, it was shown that over 70% of the overall population noticed changes in their children's behavior.

In June the question was slightly adapted so that people could state whether or not they had children. As such, 79% of the parents interviewed in June noticed a behavioral change in their children. After applying the percentage of parents in June to the January survey<sup>22</sup>, the figure was 84%. As illustrated in figure 15 below, there was a decline of 5% because between January and June, UNICEF sources explained to the authors of this report that this decline was to be expected given the remarkable capability of children to adapt to harsh circumstances over time.

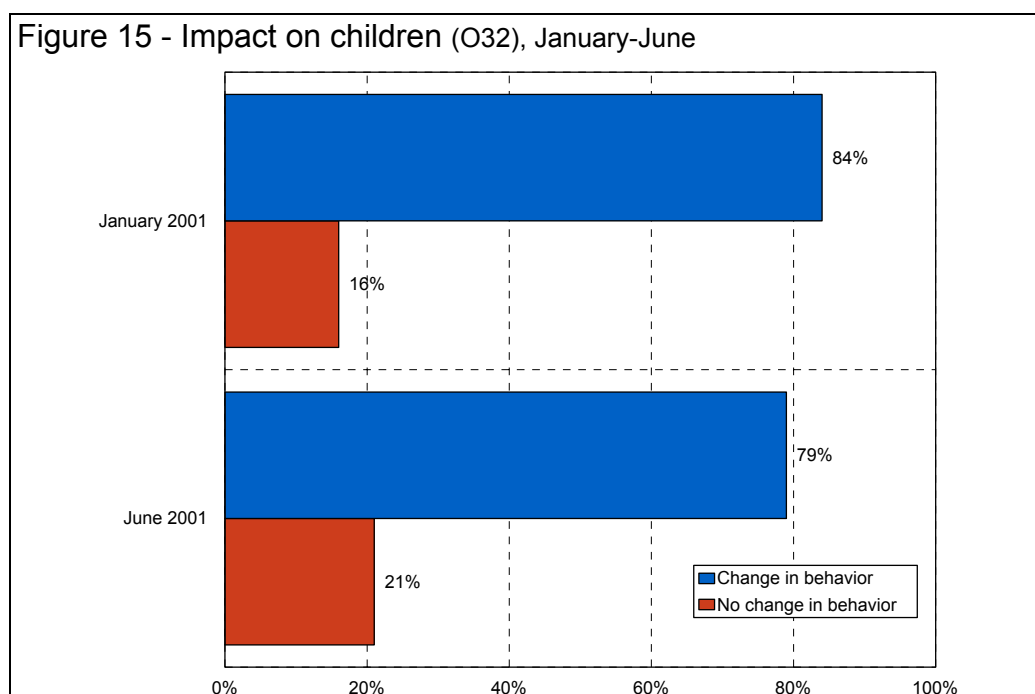

Figure 16 shows that the impact on children varies considerably by *place of residence*: For example, in the Gaza Strip, the impact seems much higher (87%) than in Jerusalem (69%).

<sup>22</sup> In January 12% of the people interviewed did not answer the question. In June, there was only 1% of non-respondents, but 23% said they have no children. If we hypothesize that the proportion of people with no children remained constant, this means that in January there should be ~24% of missing cases, so there would be only 12% of the people answering "no change" instead of 24%. These are the corrected results: Jan/June: Yes=65%/60%; No=12%/16%; NA=24%/24%.

Figure 16 - Impact on children (O32) by place of residence

*Refugee* children also seem more affected : 84% of the refugee parents reported changes in their children’s behavior compared to only 75% of the non-refugee parents.

When considering the *area of residence*, one can point out that less children in villages were negatively affected by the Intifada (70% of the parents) than in refugee camps (85%) and cities (84%).

There are significant differences related to the age of the parents but these rather show differences of effects according to the age of children. Though it is hard to point out, one could presume that the reported effects are slightly larger with adolescent children. Of the parents aged 36 to 45, 86% reported changes in their children’s behavior compared to 75% of the parents aged 18 to 25, and 80% of the parents aged 26 to 35. Elder parents (46-59 and 60+) report less changes in their children’s behavior (78% and 58% respectively).

Finally, it is worth noting that there was no significant difference according to the gender of the respondents. Mothers and fathers report changes in the same way. Even when asked about the exact nature of the effects of the intifada on their children, male and female respondents did not differ significantly in their responses.

Figure 17 - Nature of the effect of the second Intifada on children (O33)

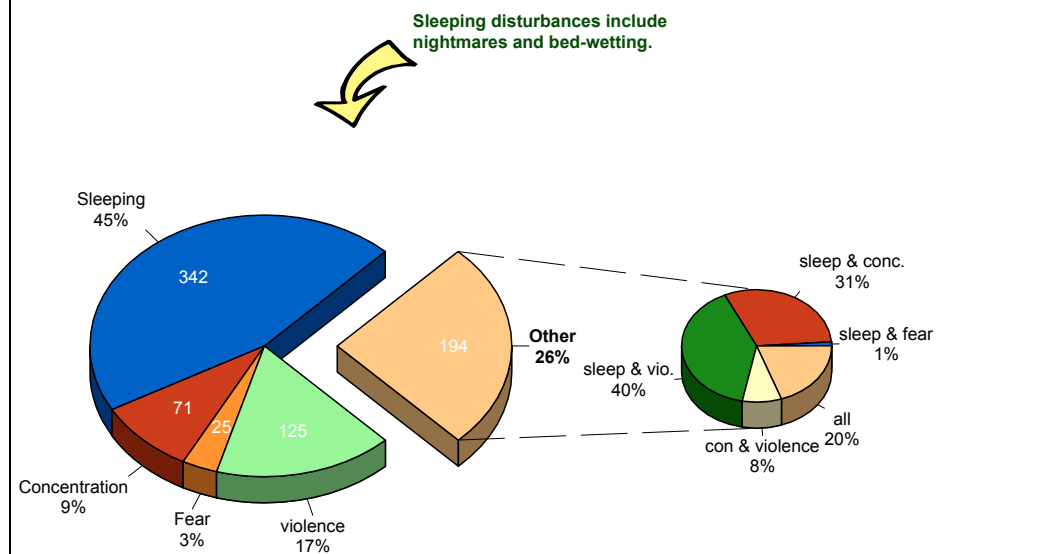

Figure 17 above shows the nature of the effects on the children. Sleep problems are the most reported (as in January), *violence* comes in second position (unlike January when it was third). In fact, when analyzing the evolution of every effect and the combination of effects, one notes that all the effects go down in proportion from January to June except violence and all its combinations.

Though there are significant differences of effects according to *place of residence, refugee status, area of residence* and *age*, they were not analyzed here.

The results of the June poll are also very close overall to the data of the survey conducted by PCBS (2001b), although some different indicators were used. According to the PCBS survey, among the children aged 5-17 years who suffer from psychological symptoms, fear of darkness was the most widespread symptom (55% of cases), followed by fear of loneliness (53%) and crying attacks (43.6%).

Finally, as HDIP's report of May 2001 has pointed out : "The deteriorating economic situation and the closures will unquestionably lead to deterioration in nutritional status, especially amongst the poor (...). Children's physical and intellectual development will suffer from the long term effects of nutritional deficiencies. Pregnant women will also especially suffer from the effects of malnutrition. According to the Directorate of Supplies in Hebron, 60% of the city dwellers suffer already from nutritional deficiencies".

## **Access to education**

Although the problems linked to the access to education for Palestinian children will be discussed later in the report, it is important to stress here some data contained in the PCBS survey (2001b).

The survey reveals that about 124'000 children - i.e. 14% of the total number of students (5-17 years old) - reported that their schools were exposed to Israeli attacks (closure of schools, bombarding, etc...). Around 60% of the students (almost 540'000 children) were absent from their schools for at least one day, with a median absence of ten days.

Finally, about 21'700 students have had to change their school, and almost 4'500 dropped out.

## PART TWO : SOCIO-ECONOMIC CONDITIONS

The second part of the report devoted to the socio-economic conditions of the Palestinian population, begins by focusing on the employment situation. The deterioration in the employment situation is one of the main problems in the present crisis and is principally linked to the restrictions of mobility imposed upon the Palestinian population by the Israeli authorities. The first section will include sub-chapters on the employment status, work occupation, place of work and effect of the Intifada on jobs. In the second section, the households' demography and the evolution of the job market in relation to the households will be analyzed.

The third section will outline the perceived evolution of the prices of some basic commodities, while the fourth section will offer an overview of the households' financial situation. Finally, the last section of this part will present the coping strategies used by the Palestinian families to face the effects of the crisis. This last section will include several sub-chapters dealing with the evolution of the households' expenses, the nature of the expenses that Palestinian families decided to cut, the strategies for dealing with the hardship, the coping mechanisms for the future, the perception of the Israeli versus the Palestinian products and, finally, the coping strategies pertaining to work.

### 2.1 - Employment situation

The crisis in the Palestinian territories has led to an increase in unemployment. In fact , the different measures imposed by the Israeli government and the Israeli aim at restricting the mobility of people and goods inside and outside the Palestinian Autonomous Areas and the Occupied Territories, explains to a large extent the increase in unemployment. This situation has put greater pressure on the breadwinners and has negatively influenced the living conditions of the Palestinians.

#### **Employment status**

The results of the polls conducted for this report showed that in January 29% and in June 28% of all Palestinians were fully employed. Figure 18, below, illustrates in further detail the current employment status of the Palestinians.

Figure 18 - Current employment status (O08), January-June

In the previous report, there was an unemployment rate of 30% considering only the respondents who were actually in the labor force<sup>23</sup> (they accounted for 55% of the January sample). The June survey shows a slightly **lower unemployment rate of 27%** in a labor force that represents 51% of the sample. A closer look shows that this decrease is more related to an increase of the partially employed people (from 17% to 19%) than to an increase of the fully employed (53% to 54%).

The analysis showed that employment status does not vary significantly by *refugee status* and by *area*.

As could be expected, *age* and *gender* produce different employment patterns but they are quite straightforward and do not seem to be related to the present crisis.

The employment status did not vary significantly by *place* of residence in January, but the effect is significant in June. These are the main findings:

- ▶ In Jerusalem the percentage of fully employed people raised by 10% from 31% to 41%. This increase can be explained by a sharp decline of the part-time workers (11%-3%) and a diminishing proportion of unemployed (10-5%).
- ▶ In the West Bank outside camps, an increase of students (9%-12%) and housewives (31%-36%) accounts for a decline in both the fully employed (30%-27%) and the unemployed (17%-12%).

<sup>23</sup> Labor force excludes respondents who identified themselves as housewives, retired persons or students.

► In the West Bank refugee camps, the significant decline of the unemployed (19%-12%) is a consequence of an increase of the part-time workers (9%-14%) and the students (8%-14%).

► In Gaza Strip outside the camps, one can note a slight decrease of the unemployed (18%-16%) and an increase in the part-time jobs (8%-10%).

► In Gaza refugee camps, both unemployment (17%-22%) and part-time work (8%-11%) raised. The fully employed remained constant at 26%, but students (15%-13%) and especially housewives (32%-26%) proportions receded.

To better appreciate the situation in the refugee camps, the reader can also refer to part V of this report, where we present a number of activities initiated by UNRWA during the period under scrutiny and the Palestinian perceptions of the aid programmes.

It is important to stress that the refugee population is one of the most socially and economically vulnerable groups in the West Bank and the Gaza Strip. As UNRWA has correctly pointed out in a recent report: “Two main factors contribute to this vulnerability: on the one side, there is a large percentage of unskilled but “employable” labour force with a relative lack of accumulated savings and thus no safety net to protect them from a high dependency on wage labour. On the other side, most refugees lack access to land-based forms of subsistence, i.e. agriculture or property. Refugee camps are among the most vulnerable of all: most of them are now confined to the fixed locality of a camp, they cannot rely on the informal economic activities of cities and large towns, nor the subsistence crops and animals found in villages. The larger family size prevalent in camp populations also increases the impact of income shocks, as it is not uncommon for one wage earner to support an extended family of six or more persons” (UNRWA 2001a).<sup>24</sup>

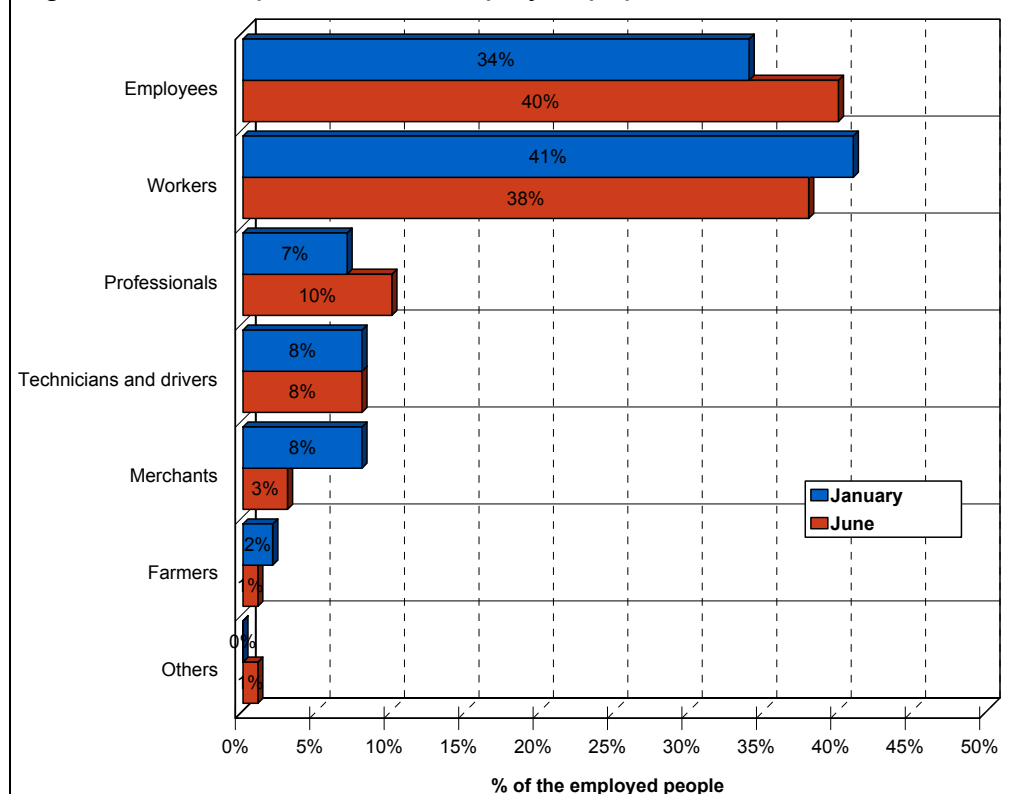

### **Work occupation**

Figure 19 presents the distribution of work occupation among the employed. When considering the evolution between January and June, there is a noticeable decline of workers (41%-38%) and merchants (8%-3%) and an increase in the proportion of employees (34%-40%) and professionals (7%-10%).

---

<sup>24</sup> It should be mentioned that in the period under scrutiny in this report, the Israeli army has also specifically targeted the refugee camps in its repressive endeavours, thus creating homeless and displaced among the Palestinian population.

Figure 19 - Occupation of the employed population (O09), January-June

*Area of residence, gender and age* have a significant effect on the distribution of work occupations. According to the evolution described above, three points can be made:

- ▶ The decrease of workers is essentially among women. Indeed, the proportion of workers among men remained almost constant (46%-47%), but it decreased by 9 points for the women from 18% to 9%.
- ▶ The increase of employees is much sharper in villages (28%-38%) than in refugee camps (33%-38%) and in cities (39%-43%).
- ▶ The increase of professionals occurred mainly in cities (6%-11%), less in villages (6%-9%) and not at all in refugee camps (12%).

### Place of work

Figure 20 shows the place of work of the whole population and of the fully employed. Although most working Palestinians are employed in the West Bank and the Gaza Strip, 1/6<sup>th</sup> of the employed Palestinians work in Israel or in settlements. Since January, the proportion of people working in Israel diminished by 4% while those working in the Gaza Strip increased by the same proportion.

Figure 20 - Place of work of the employed population (O11), total population and fully-employed

When breaking down these results by *place of residence*, there is a noticeable increase in the percentage of Palestinians who work and live in the same area. This trend shows only one exception: Gaza refugee camps where the percentage of people working in the area where they live decreased from 82% to 77%. This 5% decrease can be paralleled with the increase of Gazan refugees working in the West Bank (0%-4%) and in the settlements (1-4%)<sup>25</sup>.

### Effect of the Intifada on jobs

As stated before, the general employment situation has been seriously affected by the present crisis. Three main influences could be outlined:

- ▶ Some Palestinians have lost their jobs
- ▶ Some people had to change their job
- ▶ Wage decreased

In both surveys, respondents were asked whether or not they lost or changed their job because of the current economic situation. In the June survey, employed interviewees were asked about the evolution of their wage since the start of Intifada al-Aqsa. The results of these two questions will be analysed in this part.

Figure 21, below, shows the effect of the crisis on Palestinian employment and the previous place of work of those who lost their jobs and remained jobless. While in January, 26% of the respondents had lost their job because of the Intifada and 16% had to change it, the June

<sup>25</sup> These data contradict other sources of evidence : the strict closures imposed by the Israeli armed forces during the same period under scrutiny in this report, have prevented the mobility of the Palestinians

survey shows that 23% of the respondents lost their jobs and 11% had to change their jobs. This means that the problem receded.

Although the majority of the respondents who said to have lost their jobs in the first four months of the Intifada said that they used to work in Israel and in the settlements, almost 43% of Palestinians who lost their jobs used to work in the Palestinian territories.

This shows the harsh impact of the crisis on the internal Palestinian economy and its consequences on the social and economic conditions of the West Bank and the Gaza Strip.

Although nearly one half of the people who lost their jobs used to work in the Palestinian area, the closures hit those who used to work in Israel much harder.

Figure 22, below, shows that nearly 9 out of 10 people who used to work in Israel lost their jobs, while this was the case for “only” 7% of the people in the West Bank, and 16% in the Gaza Strip. Job “recovery” was better in the West Bank, where more people were able to change their jobs than in the Gaza Strip.

Figure 22 - Impact of the second Intifada on job situation (O12 & O13) by previous place of work (O11)

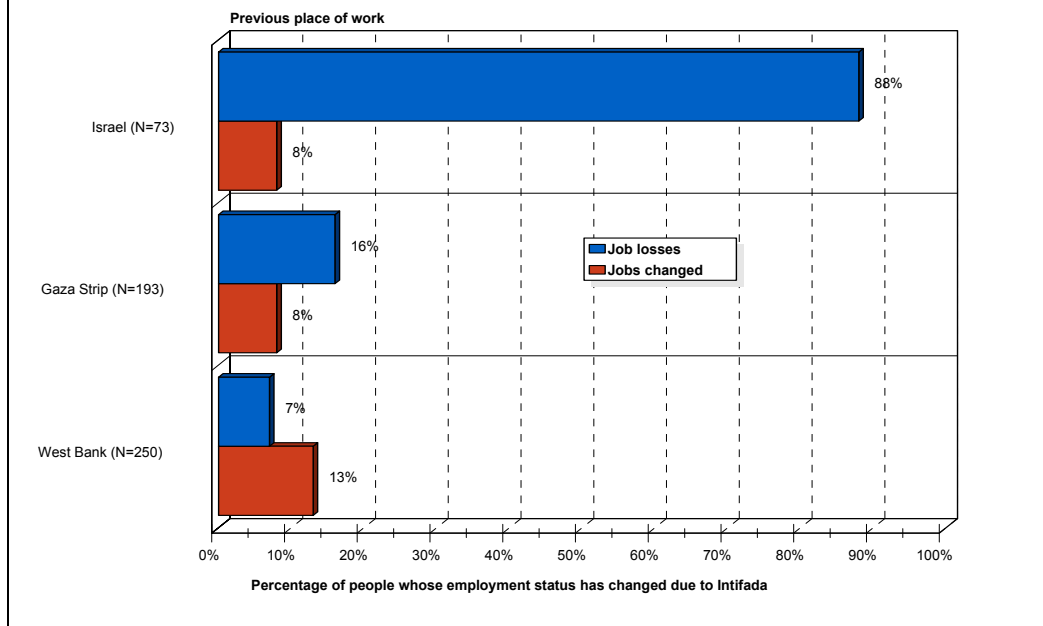

Figure 23 - Impact of the second Intifada on job situation (O12 & O13) for the total population and by place of residence

Figure 23, above, indicates that the impact of the second Intifada on the job situation was sharpest for the Gaza Strip as a whole and for the

refugee camps: roughly one third of the people in Gaza and in the West Bank refugee camps lost their job because of the Intifada. In the West Bank outside camps it is the case for one fourth of the respondents and in Jerusalem for one sixth of the respondents.

In the West Bank, 22% of the respondents had to and could change their job. In the Gaza Strip “only” 10% managed to change jobs, while in the refugee camps approximately 15% changed their jobs.

The second possible effect of the closures on Palestinian job situations is related to the decrease of wages that can be attributed to the decline in the overall economic situation. In the June survey, people were asked about the evolution of their wages during the last eight months. 45% of the respondents said that their salary decreased, 52% stated that it had remained the same and only 2% said that their salary had increased.

Those respondents who declared that their wage had changed were also asked to rate its evolution on a percentage scale. In the following of this section we will analyze this percentage. Though, we won't consider its average across the whole population but *only among those 45% who said that their salary decreased*. These people reported an average decrease of 11%.

As for changes of job situations, these results vary considerably according to the *place of residence* of the respondents. Figure 24 shows that more than half of the respondents reported a decrease in Gaza outside refugee camps, but that the average reported decrease is “only” 2% there.

On the other extreme, only 28% of the East Jerusalem residents report a decrease while the average decrease is the highest there with 16%.

When considering the differences according to the *area of residence*, one notes that the average decrease seems much less in refugee camps (4%) than in cities (13%) and villages (11%).

This result is confirmed according to *refugee status* which shows that non-refugees reported a mean decrease of 13% against 9% for the refugees.

Finally, the *gender* differences are worth noting: men seem more affected than women as 50% of them reported a wage decrease compared to 35% decrease for the female respondents. Men stated a 12% decrease on the average while women reported it at 8%).

Figure 24 - Impact of the second Intifada on wages (Q27) by place of residence

## 2.2 - Households' demography and job market

### Size of households, households with no workers and number of dependent people

The average number of people in a household (including children) is 6.9 in June, while it was 7.3 in January. The largest household selected in June counts 27 people.

While in January there were 8% of households without workers, the proportion increased to 11% in June. On the other hand, the average number of dependent people in households with workers receded slightly from 4 to 3.8.

Table 2, below, presents these and other household figures for Palestine as a whole and by *place of residence*. It shows that the increase in households without breadwinners affects mainly the Gaza Strip and West Bank refugee camps. Households of *refugees* were less affected in January (5%) than in June (11% against a constant 10% for non-refugees).

The same conclusion can be reached by considering *area of residence* which shows that the rise of households without a breadwinner is sharpest in refugee camps (4% to 11%), significant in cities (7% to 10%) but nihil in villages (12-11%). More generally, one can note that the increase in households without workers made all differences related to place, area or refugee status non significant in June while the refugees, their camps and Gaza seemed significantly less affected in January.

Table 2 - Household size (O16), number of people employed (O17), number of dependent people and number of employed women (O18)

Place of residence		No. of people in household	No. of employed people	No. of dependent persons per household	% of households with NO employed *	No. of dependents for ONE employed	No. of employed women
West Bank	Mean	6.2	1.5	4.8	11%	3.5	0.3
	N	631	630	627	630	555	623
WB Camps	Mean	6.6	1.7	5.0	13%	3.3	0.6
	N	66	66	66	66	57	62
Jerusalem	Mean	5.8	1.4	4.4	8%	3.6	0.4
	N	107	106	106	106	97	104
Gaza	Mean	8.5	1.7	6.9	10%	4.4	0.3
	N	315	308	308	308	277	217
Gaza Camps	Mean	7.7	1.6	6.2	10%	4.2	0.5
	N	147	143	143	143	129	108
Total	Mean	6.9	1.5	5.4	11%	3.8	0.3
	N	1266	1252	1249	1252	1115	1116

Note: \* Nb of dependents for one worker represents the mean of households WITH employed people.

Table 2 also shows that among the households with workers the number of dependent people increased in Jerusalem, remained constant in the Gaza Strip and dropped in the West Bank.

### Loss of workers in households due to the Intifada

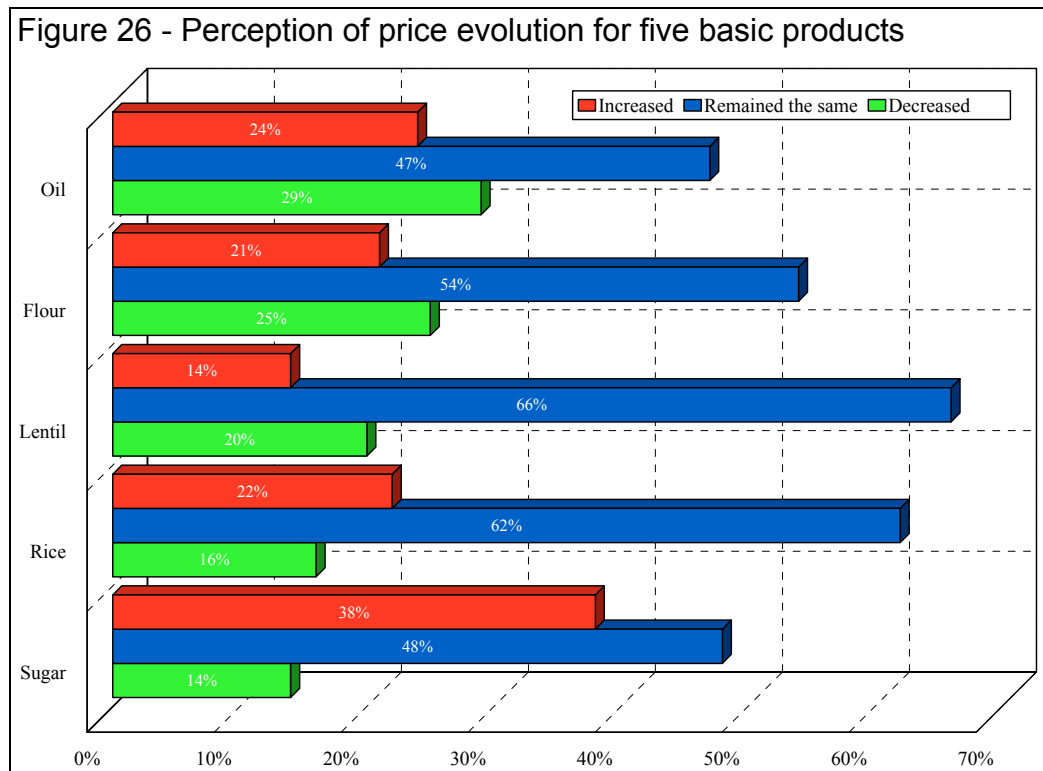

Respondents were asked to state how many jobs were lost in their household due to the current crisis. Around 4 households out of 10 reported at least one loss. On the average, nearly 0.5 workers lost their jobs during the Intifada. This figure becomes impressive when it is compared with the 1.6 average workers per household.

When the interviewees were asked about where the household members who lost their job used to work, some differences with the place of work of the respondents who lost their jobs emerged: A comparison between figure 25 below with figure 21 shows that Israel and the settlements seem overestimated in figure 25. It seems logical, however, that it might be harder for another household member to state that one's job loss is related to the Intifada if one worked on Palestinian territory than if one worked in Israel or the settlements.

## 2.3 - Basic commodities

In the June poll, respondents were asked about their perception of the price evolution of five basic commodities : flour, sugar, oil, lentil and rice. Figure 26 shows that in the opinion of the majority of the respondents, the price of these products remained the same throughout the crisis.

If we consider those who said that the prices changed, it appears that *sugar* and *rice* most likely *increased* while *oil*, *flour* and *lentils* most probably *decreased*. These results become interesting when they are broken down according to the respondents' *place of residence*:

- ▶ For the majority of respondents in the Gaza Strip - inside camps (69%) and outside camps (46%) -, the price of *flour* has *decreased*. As the authors of this report were told, this probably happened because of the parallel strategies of UNRWA and the UN World Food Program. Both have seemingly overestimated the quantity of flour that has been distributed in their assistance programmes.
- ▶ The majority of Gaza camp residents (51%) consider that the price of *lentils* has *decreased*. In Gaza outside camps, however, the majority said it remained the same (64%), while 30% said it decreased.

► The majority of Gazans outside refugee camps (48%) stated that the price of *sugar increased*. This opinion was more or less shared by residents of the West Bank outside camps (38%, while 48% said it was constant) and of East Jerusalem, (36% versus 58% constant) but not by the camp dwellers.

► In Jerusalem, 47% of the respondents said that the price of *oil* increased, while 48% said it remained constant. Everywhere else, more people said that it increased rather than it decreased.

The differences that we noted between *refugees* and non-refugees merely confirmed the findings made according to the place of residence.

When considering the price's evolution of the five basic commodities according to the *area of residence* of the respondents, one can note that:

► More Palestinians in villages said that the price of *flour, lentils, oil, and rice had increased*.

► More respondents residing in cities and villages perceived an *increase* in the price of *sugar*.

## 2.4 - Households' financial situation

The Palestinian Central Bureau's latest findings regarding the economic conditions of the Palestinians reveal that over two million Palestinians currently live below the poverty line (PCBS 2001a). According to PCBS, approximately 14% of Palestinian households<sup>26</sup> stated that they have lost their source of income in the first eight months of the second Intifada and about 47% said that they lost over 50% of their normal income since the Intifada broke out. The findings of the PCBS indicate that the median monthly income decreased from 2500 NIS prior to the Intifada to 1'300 NIS by the end of July 2001. The decrease was even more severe in the Gaza Strip than in the West Bank. Whereas the median monthly income in the West Bank decreased from 3'000 NIS to 1'500 NIS during that period, the amount of decrease in the Gaza Strip dropped from 1'900 NIS to a mere 1'000 NIS.

The sharp reduction in the household income was accompanied by an increase in the number of people under the poverty line, estimated at 1'642 NIS. According to the PCBS, 65% (2'121'500 individuals) of Palestinian households are below the poverty line. In the Gaza Strip alone, it is estimated that 80% of the Palestinian population there are below the poverty line.

---

<sup>26</sup> For the Palestinian Central Bureau of Statistics, a household consists of two adults and four children.

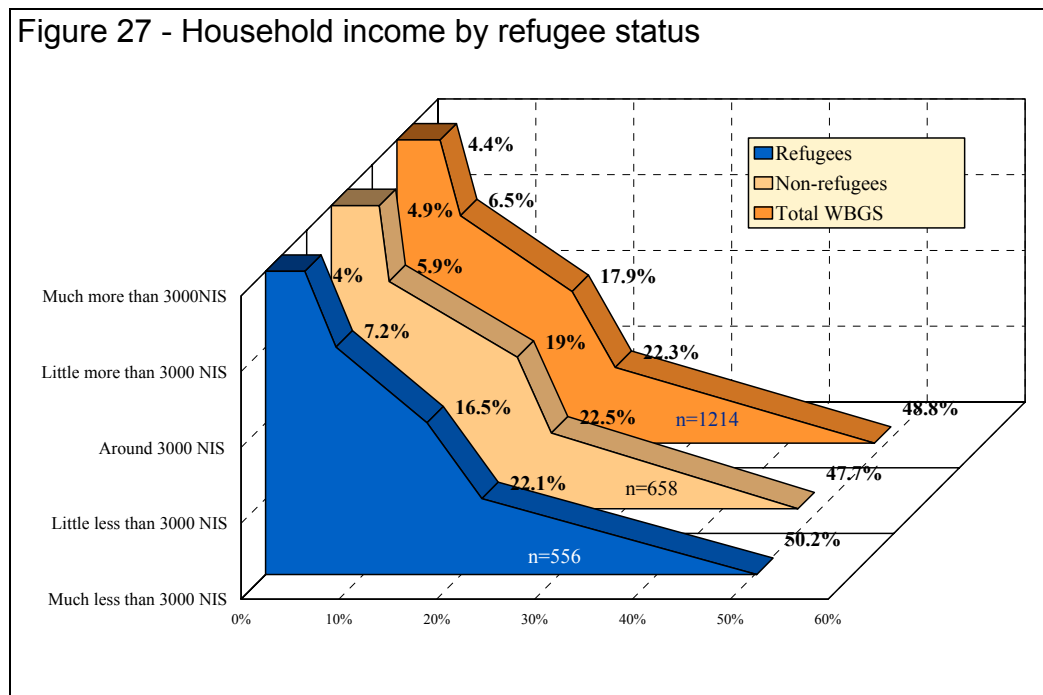

Although the economic hardship did not spare the large majority, refugee camp residents seem to be suffering the most. According to our survey, over 59% of refugee camp resident estimate their monthly income to be much less than 3'000 NIS per month, compared to 50% of city dwellers and 49% of villagers, as indicated in table 3 below.

Table 3 - Family income by area of residence (O57)

	Area			
	City	Refugee camp	Village	Total
<b>Much more than NIS 3000</b>	26	4	23	53
	5%	2%	5%	4%
<b>Little more than NIS 3000</b>	43	7	30	80
	8%	4%	7%	7%
<b>Around NIS 3000</b>	104	25	89	218
	18%	12%	20%	18%
<b>Little less than NIS 3000</b>	114	47	110	271
	20%	23%	25%	22%
<b>Much less than NIS 3000</b>	286	118	192	596
	50%	59%	43%	49%
<b>Total</b>	573	201	444	1218
	100%	100%	100%	100%

Refugee camp residents seem to be much worse off financially than their counterparts who do not reside in camps. After breaking down income according to refugee status (refugees vs. non-refugees) one can observe that the differences in income according to refugee status is not very significant, as indicated below in figure 27.

Figure 27 - Household income by refugee status

Under such economic hardships, one might wonder how the Palestinians could manage to sustain their daily living. Our survey indicates that over 50% of the respondents can barely manage. As indicated in Figure 28 below, only 33% of the Palestinians said that they could financially manage for as long as it takes.

The percentage of those who said that they could keep up with the situation as long as it takes does not vary by age or by profession. Interestingly enough, those who had a martyred relative stated that they would keep up as long as it takes more than those who did not lose a relative. Though the difference is not big, it hints on the financial help given to the family of the martyred.

Table 4 below shows that the majority of the Palestinian population in Gaza and in refugee camps won't be able to manage much longer, not even a few months. In villages and in the West Bank as a whole, slightly more than 50% of the people will be able to hold a few months.

Table 4 - Period of time for which respondents stated they could financially manage under the current conditions by place and area of residence

	Total	West Bank	Gaza Strip	Cities	Villages	R. C.
A long as it takes	396 (33%)	33%	33%	33%	39%	39%
About one year	45 (4%)	5%	2%	4%	5%	2%
Few months	150 (13%)	14%	11%	13%	16%	4%
Barely manage	335 (28%)	25%	30%	29%	27%	30%
The situation is serious	261 (22%)	23%	24%	21%	201	26%
Total	1188 (100%)	(N=646)	(N=447)	(N=552)	(N=430)	(N=205)

A further examination of the data shows that the Palestinians who stated that they could financially cope under the current political conditions are generally those who are financially better off. Moreover, of those who said that their family income is sufficient enough to financially cope with the present hardships, 61% (N=445) said that they could manage as long as it takes. However, of those who said that they rely on savings, or assistance from relatives and friends, only 17% said that they could sustain the current situation for as long as it takes.

## 2.5 - Coping strategies

As discussed earlier, the crisis hit the Palestinian population very hard. Many households lost wage earners, many people lost their job or suffered serious decreases in their salaries. An important question that was missing in the first report concerned the coping strategies of Palestinian households. In the June survey several questions were introduced concerning this subject : they will be analyzed in this section.

### Evolution of household expenses

As it seems clear that most households lost income since the Intifada al-Aqsa started, one could wonder if expenses were really cut.

63% of the respondents said that their household expenses decreased during the last eight months; 29% said that they remained the same and 8% stated that they increased.

Figure 29 below presents the percentage of people who said that their expenses were reduced.

An analysis by *place of residence* shows that 82% of the respondents from households in Gaza refugee camps said they reduced expenses while only 41% of the Jerusalem respondents did.

Even outside camps, Gaza (75%) seems more touched than the West Bank (71% in camps, 56% outside camps).

Also, 68% of *refugees* reported a decrease compared to 59% of non-refugees.

Area also plays a key role: while 78% of the refugee camp interviewees report a decrease, this proportion is only 60% among inhabitants of cities and villages.

Though there are significant differences in responses according to age groups of respondents but they are hard to interpret. Finally, there are no significant differences according to the gender of respondents.

Respondents were also asked to specify the percentage by which their expenses changed during the last eight months:

- ▶ The mean reported evolution is -34%!

Again, considering *place of residence*, Gaza refugee camps have the highest decrease (48%) while Gaza in general seems to suffer harder decreases than the West Bank. Also, respondents from the refugee camps have reduced their expenses (43%) more than the respondents from cities (37%) and villages (33%).

### Nature of the expenses that were cut

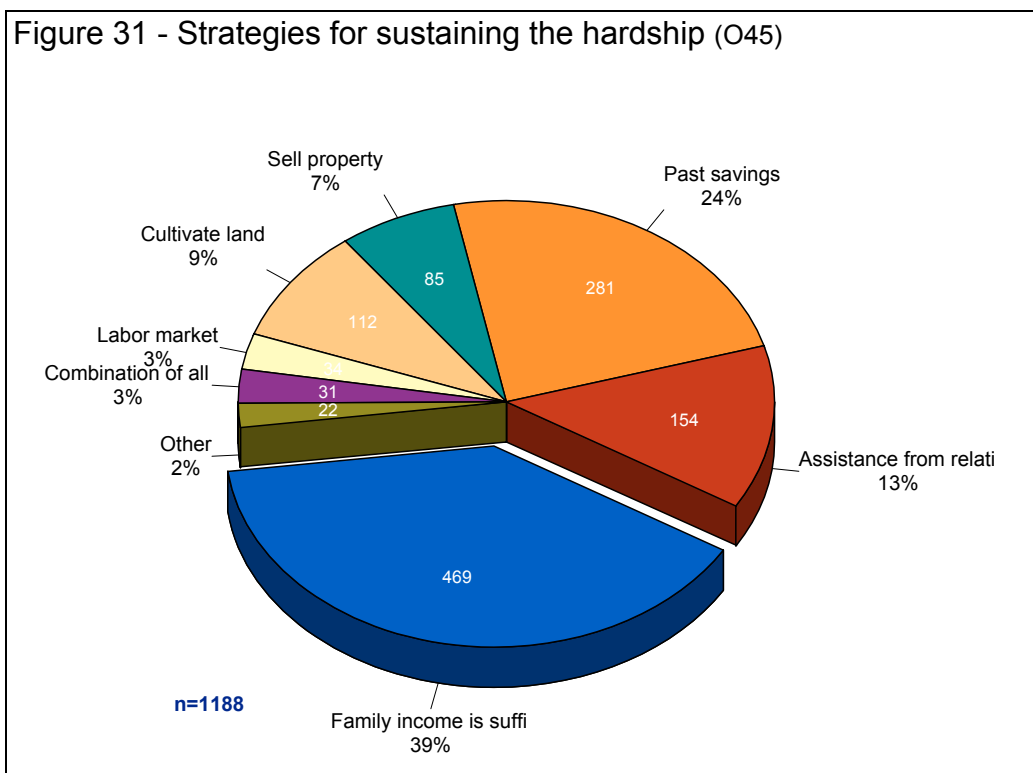

Having established that expenses were cut in the majority of Palestinian households, it is useful to specify which expenses were reduced.

As indicated in figure 30, below, 70% of the respondents cut their expenses in all areas. The only areas that are specifically identified by some respondents are leisure and travel (6%) and clothing (4%).

## Strategies for sustaining the hardship

The respondents were asked how they did sustain the hardship until now. Figure 31 outlines their main strategies. While income was sufficient for 4 respondents out of 10, one quarter of them had to rely on past savings and one sixth had to ask help from family and friends.

A break-down of these results according to the *place of residence* of the respondents led to the following findings

- ▶ While income was sufficient for 60% of the Jerusalem residents, it was not for more than 60% of the respondents elsewhere.
- ▶ In Gaza camps, 26% of the respondents had to rely on family and friends while this proportion was at a maximum of 13% elsewhere.
- ▶ In the West Bank outside camps, much more respondents cultivated land (15% vs. max. 7% elsewhere)

*Refugees* rely more on family and friends than non-refugees (17% vs. 10%). Non-refugees rely more on cultivating land (13% vs. 6%).

Similarly, *area* analysis shows that people living in refugee camps rely more on family and friends (22% vs. ~11% in cities and villages).

In villages people rely -of course- more on cultivating land (15% vs 8% in cities and 1% in camps).

When considering *age groups*, the striking figure concerns the 30% of the 60 and over which rely on family and friends.

### Coping mechanisms for the future

When respondents were asked to specify the means at their disposal to cope with the economic crisis in the future, the vast majority stated that reducing expenses was the only way that they would use to cope with more economic hardship. As indicated in figure 32, below, 9% of the interviewed population is already destitute, and has nothing to rely on to cope with any future economic crisis.

### Perception of Israeli vs Palestinian products

As established in the previous sections, most households had to cut their expenses. In this respect, it is interesting to find out the origin of the products people buy. Do they buy Israeli or Palestinian products? Do they boycott Israeli products? And, of course, how do they rate the quality of both types of products?

Figures 33 and 34 below show that whilst the majority of Palestinians say that if they were given the choice they would choose Palestinian products over Israeli products, their evaluation of Palestinian products is rather negative in comparison to the Israeli products.<sup>27</sup>

Further analysis of the independent variables reveal that refugees and camp dwellers favor Palestinian products more. Young respondents and people living in East Jerusalem seem more pragmatic in their behavior.

Finally, it should be added that rating and behavior are -of course- very much linked: While in the whole population slightly less than two thirds say that Israeli products are better, this proportion goes up to 95% among those who buy Israeli products.

<sup>27</sup> In a recent article, J. Baker (2001) has stressed that : “While the majority of Palestinians during the first Intifada were for the most part willing to give up their Osem cookies and Tnuva butter, this current uprising has yielded less willingness in substituting them for oftentimes less than satisfactory locally-made substitutes”. Baker’s article contains several interviews and points of view of different Palestinian actors.

Figure 34 - Comparative rating of Palestinian and Israeli products (O29)

### Coping strategies pertaining to work

Concerning work, people who lost their job were asked whether they tried to find a new work: 85% tried very hard, 13% not very hard and 3% did not try at all. There are significant differences according to the *gender* of the respondents and it seems that women did not try as hard as men did to find another job.

Respondents who lost their work were also asked if they would be willing to work for a lower salary: 90% would agree to work even with a much lower wage, 7% only with the same wage as before, while 2% gave other explanations.

Here, only *place of residence* produces significant differences : 96% of the respondents in Gaza would be willing to get a job even for a much lower salary while this proportion is 89% in the West Bank.

## PART THREE : ASSISTANCE DELIVERED DURING THE INTIFADA

The severe impact of the crisis on Palestinian society prompted many local and international organizations to continue delivering services for the needy.

In this part, the distribution of assistance (to whom it is aimed), its type and value, as well as its source (donor) will be analysed. In the last section the employment generation programs will be highlighted.

### 3.1 - Distribution of Assistance

In question 31, people had to state if they received assistance or not since the beginning of the Intifada al-Aqsa. As shown in figure 35, the percentage of people who said they had received assistance rose from 43% in January to 49% in June. As such, nearly one half of the Palestinian population received direct assistance.

Assistance is clearly targeted: Out of ten *refugees*, seven received assistance while among non-refugees, only three people out of ten said they received assistance.

Figure 36, below, shows that assistance to villages that was very much lacking in January went up by 14% in June.

Figure 36 - Assistance (O35) by area of residence, January-June

Considering *place of residence* figure 37 shows that aid was higher in Gaza inside and outside refugee camps and in West Bank camps than in the West Bank outside refugee camps. Jerusalem received the smallest share of assistance.

Figure 37 - Assistance (O35) by place of residence

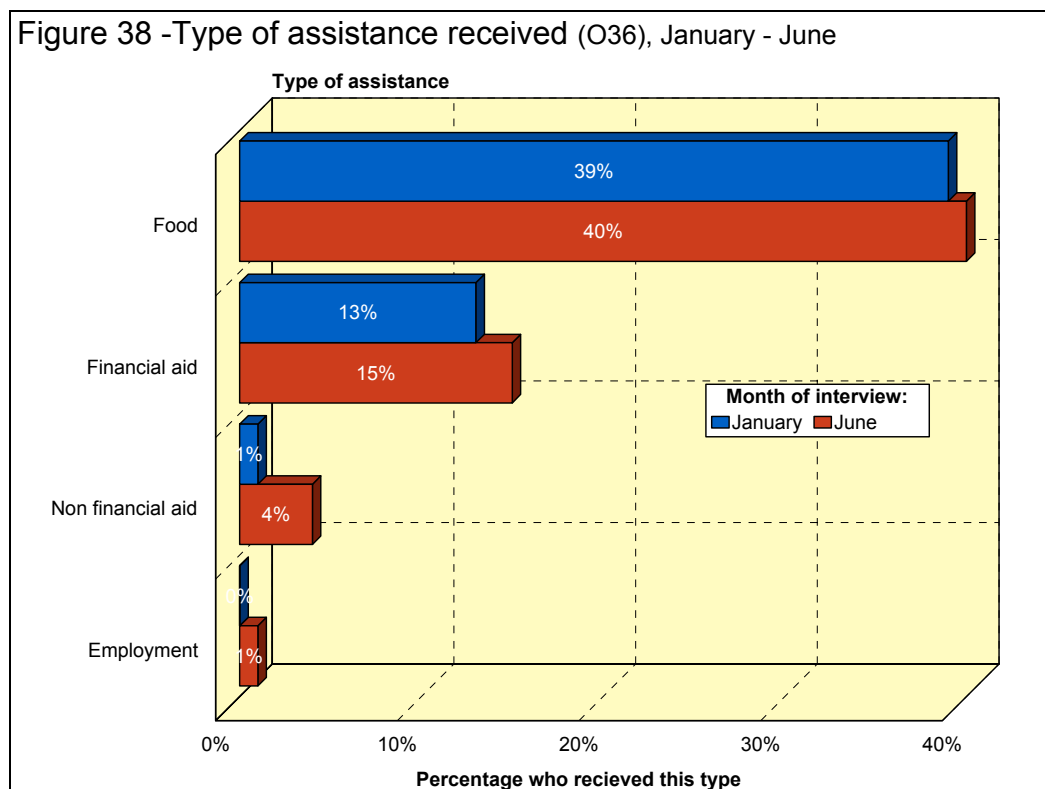

Assistance seems to have been more focused on refugee camps and the West Bank since last January : while aid decreased since January in Gaza outside refugee camps (-5%) and in East Jerusalem (-6%), it went up by 11% in the West Bank outside refugee camps and by 8% in refugee camps in the Gaza Strip and the West Bank.

### 3.2 - Type and value of assistance

Respondents were also asked about the nature of the two main types of assistance that their family received. The 602 respondents that mentioned one or two types of assistance in June (530 in January), gave 943 responses (853 in January). Slightly less than half of these respondents mentioned two types of assistance, while the rest mentioned only one.

Of all the given responses, 72% concerned food and 21% financial aid. Only 1% of the responses related to medication and employment. The remaining 6% relate to various types of non-financial assistance.

If, as in figure 38 below, we take each type of assistance separately, we can see that *food* was distributed to four respondents out of ten. *Financial assistance* was received by one sixth of all the respondents while 4% benefited from *non-financial aid* and only 1% benefited from *employment assistance*.

Not surprisingly, *place of residence* of respondents plays a key role:

▶ 84% of Gaza camp residents received *food assistance*. This was also the case for approximately one half of Gazans living outside camps (53%), less than half of West Bank camp residents (44%) but only a third in the West Bank outside refugee camps (29%) and 4% of people in Jerusalem.

▶ *Financial aid* was distributed to 39% of the Gaza camp residents. The same was true for one sixth of the Gazans living outside camps and of the West Bank refugee camp population. About 10% received financial aid in the West Bank and only 3% in Jerusalem.

▶ *Non-financial aid* was also delivered mostly in Gaza refugee camps (14%). In Gaza outside refugee camps and in the West Bank camps the proportion was 5%, while it was only 2% in the West Bank outside refugee camps. Non-financial aid appeared non-existent in Jerusalem.

This analysis clearly shows the logic of the *geographical distribution* for the main types of assistance:

▶ **in terms of area of residence, the Gaza Strip always appears as having been targeted first for aid distribution;**

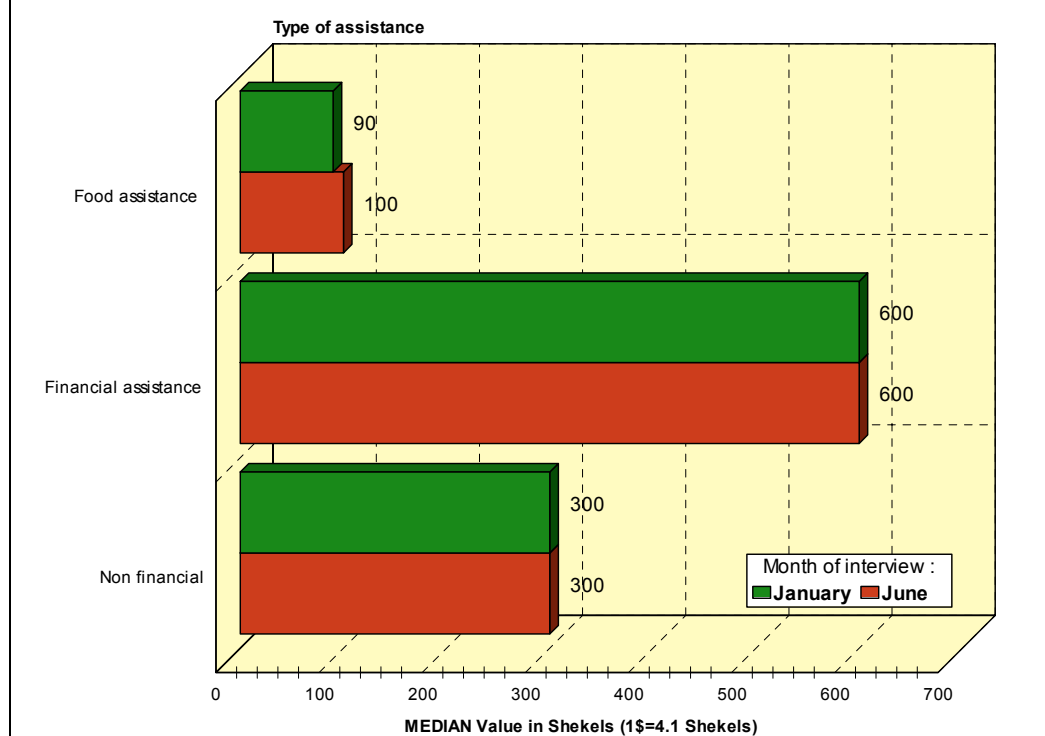

▶ **in terms of place of residence, the *refugee camps* appear as having been targeted as the main beneficiary, both in the Gaza Strip and in the West Bank.**

*Refugees* received more of all types of assistance than others and *villages* received proportionally much less than refugee camps and cities.

When respondents were asked to assess the value of the provided assistance, the average value of food came at a little less than 30 US\$.

Figure 39, below, provides a picture as to the perception of recipients with regard to the value of the assistance provided.

Figure 39 - Median value of assistance received by type

Only the *place of residence* seems to have played an important role in relation to food distribution:

- ▶ West Bank's food aid is around 187 shekels outside refugee camps and 178 shekels inside camps.
- ▶ The value is lower in the Gaza Strip, especially inside refugee camps (83 shekels and 106 outside refugee camps).
- ▶ Since January, the value of food aid in the West Bank has increased considerably (+65 shekels outside refugee camps; +33 inside). In the Gaza Strip refugee camps, on the contrary, the value of food aid has lowered (-29) and in the Gaza Strip outside refugee camps it has remained more or less constant (-4).

### 3.3 - Source of assistance

On the questions related to the source of the assistance, there were 831 responses given by 548 persons. Slightly more than half of them relate to UNRWA (51%), 22% to PA, 13% to Zakat committees and other religious organizations. Of all the other sources, none received more than 3% of the responses.

In the remainder of this section the sources of aid will be analysed separately for the different types of assistance that were outlined before.

Not unexpectedly, and as shown in figure 40, UNRWA was identified as the main single assistance provider concerning *food*, followed by the Palestinian Authority and the Zakat committees.

Figure 40 - Source of *food* assistance

The Palestinian Authority is the source of three quarters of the *financial aid*; UNRWA accounts only for 8% of the financial aid and all the others for 17%.

There is nothing to be said about *non-financial aid* because there are too few cases.

Look at the geographical distribution of the assistance provided by the donors, it appears that:

- ▶ UNRWA is the main food donor in refugee camps and in cities but Zakat committees and the PA gave more food in villages.
- ▶ The PA is the main financial donor everywhere. One can note that the Authority seems to give more, proportionally, in refugee camps than in cities and villages.
- ▶ UNRWA seems to give more financial aid in villages and cities than in refugee camps.

While it is acknowledged that the efforts and services of the above mentioned organizations are supported by various local and international organizations, it is safe to conclude that most respondents know only the direct provider. Only few have mentioned the efforts and assistance of non-governmental organizations, or international organizations.

### 3.4 - Employment generation programs

In the June questionnaire, several questions were asked about employment generation programs. The visibility of these programs will be analyzed in Part IV and the specificity of UNRWA's employment generation programs will be discussed in Part V. Here, the benefits reported from those programs will be considered in general.

After few months from the beginning of the second Intifada, most donors - the World Bank, the European Commission, the UNDP and UNRWA, among others - have considered the employment generation programs as one of the most appropriate tools of intervention to respond to the deterioration of the economic conditions of the Palestinian population affected by the crisis. A large proportion of beneficiaries themselves had expressed a keen interest in this form of assistance (see our first report: Bocco, Brunner and Rabah, 2001).

According to the results of this poll, less than 8% of the sample reported that someone in their family received help in finding a job.

As will be reported in Part V through the specific example of the UNRWA's employment generation programs, job opportunities have been created in different ways. This means that, for example, a contract between a construction company and the UNDP or the World Bank to build a new school or repair an old one may be considered by the donor as a form of funding allotted in the framework of an employment generation program. However, the worker contracted by a construction company is not necessarily aware of the fact that he is indirectly benefiting from such a program. This situation may partly help to understand the relatively low percentage of people who said that they benefited from employment generation programs.

Figure 41 - Benefit from employment generation program (O23) by place of residence

As shown by Figure 41, above, *place of residence* plays a significant role : 20% of the people living in the Gaza Strip refugee camps received assistance through employment generation programs, while this percentage falls down to 4% in the West Bank outside refugee camps.

Overall, 11% of *refugees* benefited from those programs compared to only 5% of non refugees.

In terms of area of residence, while people inhabiting villages are only 4% to benefit from employment generation programs, those in cities are 7%, and in refugee camps 16% !

Among those who benefited from a program, only 1% has received a long term job, 53% got short term jobs, and the remaining 46% benefited from unemployment funds.

60% of those who benefited from help got it from the PA or one of its ministries. The second highest donor is UNDP with 18%. The World Bank and UNRWA account for 6% and the EU and the trade unions for 5%. None of the remaining donors exceeds 2%.

## PART FOUR :

# IMPACT OF ASSISTANCE DELIVERED

In the previous part we analyzed the assistance provided since the beginning of Intifada al-Aqsa, and it became clear what was delivered and to whom. In this part we will first analyze the level satisfaction with this provided assistance. This analysis will give us a first view of the general impact of assistance. In the second section, a closer look will be taken at the assistance that individuals seek : do they receive the assistance they need and what do they need? In the last section the questions will relate to the visibility of assistance.

### 4.1 - Satisfaction with the provided assistance

The respondents who benefited from assistance were asked to state their level of satisfaction with assistance in two different manners. First, they were asked to state their level of satisfaction with assistance in general, and, second, they were requested to specify their level of satisfaction with assistance they themselves benefited from.

Regarding the level of satisfaction with assistance in general, respondents were relatively negative. Only 32% said that they were satisfied or very satisfied with the provided assistance. The remaining 68% of the respondents evaluated aid provision negatively. This represents only a very slight improvement since January when 30% of the respondents were satisfied.

When examining the question of satisfaction with assistance in general according to different subgroups, there are no significant differences in June compared to January.

Concerning specific satisfaction, people were much more positive:

- ▶ 55% rated *food aid* as satisfactory;
- ▶ 48% rated *financial aid* as satisfactory;
- ▶ There were too few cases for employment generation programs to make any relevant deductions.

As shown in figure 42, the level of satisfaction is related to *place of residence* of the respondents :

- ▶ Satisfaction with *food aid* seems to be highest in the Gaza Strip outside refugee camps (64%) and lowest in the West Bank refugee camps (45%). The Gaza Strip refugee camps rate food

aid slightly better (53%) than the West Bank outside refugee camps (49%).

- Satisfaction with *financial aid* seems to be highest in the West Bank outside camps (56%) and lowest in the same area in refugee camps (22%). The respondents of the Gaza Strip residing outside refugee camps (48%) rated financial aid slightly better than refugee camps dwellers (44%).

## 4.2 - Individual impact of assistance

In question 35, respondents were asked whether they need assistance or not. The proportion of our respondents that need help is 67%; it was 68% in January.

Refugees were 75% to say they needed help in January. In June, they are 71%. The percentage of non-refugees to need help kept constant in January and June (64%).

In figure 43, we consider help needs by place of residence. Some useful results appear:

- In the Gaza Strip refugee camps, slightly less than half of the respondents (48%) were in need of assistance in January. In

June this proportion *raised dramatically by 30%* to reach 78% in June.

▶ In the West Bank refugee camps, 83% of the population said to need help in January. This proportion went down to 57%. This spectacular decrease of 26% could reflect a changed focus of the donors.

▶ Outside refugee camps, the situation remained more or less constant In the West Bank these figures evolved from 70% to 68%.and in the Gaza Strip dropped slightly from 74% to 70%.

▶ In Jerusalem respondents definitely are better off : only 46% of them are in need of help.

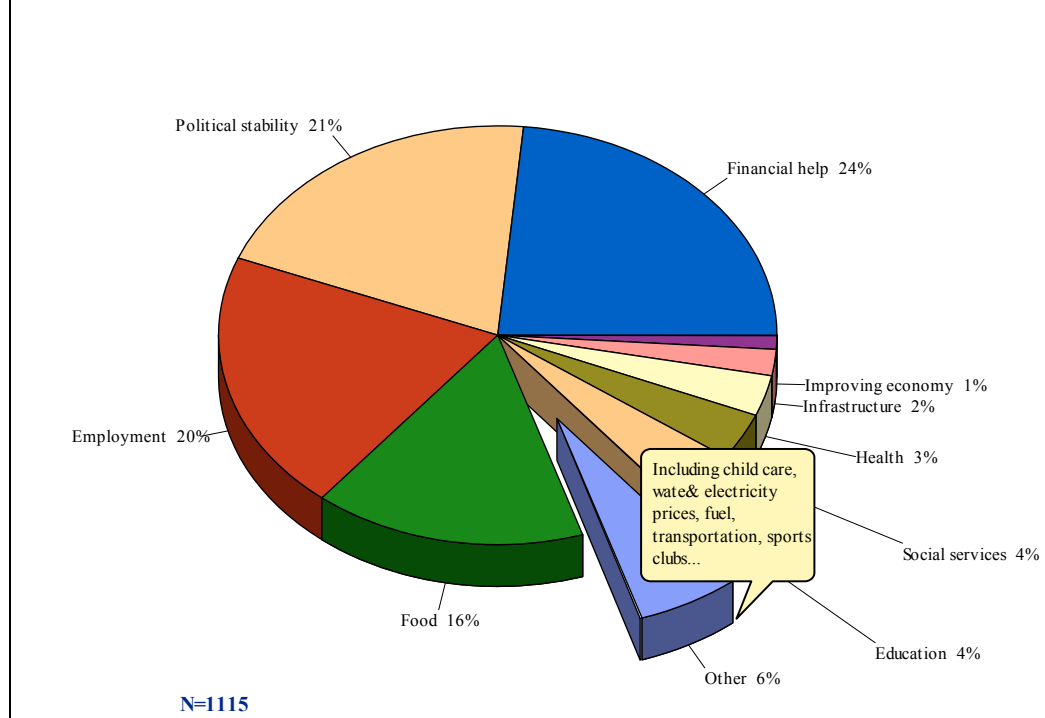

Figure 44, below, illustrates the type of assistance respondents needed.

- ▶ One sixth of all Palestinians are in dire need of **food** !
- ▶ One Palestinian out of five is in need of **employment**.
- ▶ One quarter of the population needs **money**.

Figure 44 - Need of assistance (O38) by place of residence

A detailed analysis of the type of assistance needed according to the place of residence of the respondents yields a few results:

- ▶ *Food* is needed by one fifth of the respondents in the **West Bank outside refugee camps** (19% of the respondents versus a population average of 16%).
- ▶ *Work* is needed by almost a third of **Gazans living outside refugee camps** (28% versus a population average of 20%).
- ▶ *Money* is needed by more than one third of the population in **Jerusalem** (33% versus a population average of 24%; in the West Bank outside refugee camps is 28%).

Another question helps to determine the individual impact of assistance: respondents were asked to state the one most important need for their community.

Figure 45 shows that a quarter of the sample thought that *job opportunities* are mostly needed. The second most cited need is a political one: *Improving moral status*. But the same proportion of Palestinians mentioned *food* and nearly the same number of respondents cited *financial assistance*. *Health* is only slightly less cited, but one should note that this need was the second most important in January. All the other mentioned needs account for less than 10% of the answers each.

Figure 45 - Relief needed by respondent's community (O51), January-June

A more detailed analysis shows that there are significant differences according to the *place of residence*, *refugee status* and *area of residence*. Although these impacts are not always easy to interpret, some results are interesting:

- ▶ In villages, *health* is cited by 23% of the respondents while it is only mentioned by 14% in cities and 12% in refugee camps.
- ▶ *Job opportunities* are cited by a quarter of the respondents in cities (23%) and in refugee camps (23%) but only by 17% of respondents in villages.
- ▶ *Improving morale* is the most important need for 17% of respondents living in villages but only for 12% of city dwellers and 8% in refugee camps.

### 4.3 - Visibility, Importance and Effectiveness of Assistance

In this last section we will analyze the importance that the respondents gave, in the present crisis, to several types of assistance as well as the perceived efficiency of its delivery. Finally, the employment generation programs will be further discussed by looking at how many people heard of some programs and from where they heard about them.

Figure 46 presents the perceived importance and efficiency of employment generation, health and education assistance, food aid and infrastructure (re)building in the present crisis.

As in January, the striking result deals with *employment generation* : While three quarters of Palestinians think this type of assistance is very important, less than 5% think that it was distributed efficiently or very efficiently since the start of the Intifada.

*Health assistance* is likewise viewed as very important but half of the Palestinian people evaluated its distribution was efficient. *Education* was viewed both as important and effective.

*Food aid* was judged slightly less important but much less effective. *Infrastructure*, though viewed as less important was evaluated severely concerning its efficiency.

Thus, if the perceived importance and effectiveness in the present crisis are taken as indicators of the need for assistance, *employment generation* seems to be the most important problem. *Food* and *infrastructure* seem also more problematic than *education* and *health*.

The judgments about importance and effectiveness of some type of assistance vary significantly according to all of the control variable: place, area, refugee status, gender and age.

IMPORTANCE	Place of residence	Education		Health		Food		Employment		Infrastructure	
		%	Jun.-Jan.	%	Jun.-Jan.	%	Jun.-Jan.	%	Jun.-Jan.	%	Jun.-Jan.
% of people who think it is very important	West Bank	62	-3	64	-2	53	-7	68	-6	38	+4
	WB - Refugee Camp	81	+14	88	+23	70	+16	85	+3	52	+4
	Jerusalem	72	-12	69	-20	59	-15	74	-15	65	-2
	Gaza	68	-4	77	+2	62	-4	83	-3	42	-7
	Gaza - Refugee Camp	68	-17	73	-11	56	-19	75	-14	56	-6
	<i>Total</i>	67	-4	71	-2	58	-6	75	-7	45	-7
EFFECTIVENESS	Place of residence	Education		Health		Food		Employment		Infrastructure	
		%	Jun.-Jan.	%	Jun.-Jan.	%	Jun.-Jan.	%	Jun.-Jan.	%	Jun.-Jan.
% of people who think it is effective or very effective	West Bank	60	+7	46	+3	22	+1	4	-2	11	-2
	WB - Refugee Camp	45	+1	30	-9	28	+6	6	-2	23	+13
	Jerusalem	39	-1	56	+10	11	+5	3	+0	7	-2
	Gaza	63	+33	56	-1	25	+1	4	+3	11	-1
	Gaza - Refugee Camp	60	+20	58	-20	27	-3	1	+0	8	+1
	<i>Total</i>	58	+14	49	-1	23	+1	4	-0	12	+0

Concerning *place of residence*, table 3 shows important differences:

- ▶ In the *West Bank outside refugee camps*, all types of assistance except infrastructure are viewed as rather important. Concerning education, health and food, it is also noteworthy that the perceived importance of help in those domains increased significantly since January. Concerning food the priorities of the respondents seemed to match those of the donors because the percentage of respondents who stated that food aid was efficient is both above the average and increased significantly since January. Finally it must be noted that the efficiency of infrastructure assistance is rated efficient by almost double the proportion of respondents than in the average.
- ▶ In *Jerusalem* the respondents viewed infrastructure assistance important but ineffective. Except for infrastructure, the perceived importance has sharply decreased everywhere. If one considers efficiency, some of this decline could be attributed to the increased efficiency of the health services and, to a lesser extent, of food. But since January there is no increase in the perceived efficiency regarding education and employment which could indicate a general improvement of the situation there.

- ▶ In the *Gaza Strip refugee camps* the perceived importance of help is close to the average except for infrastructure which is viewed as very important by a significantly higher proportion of respondents. Concerning efficiency, it is viewed as especially effective for health and food and ineffective for employment and infrastructure.
- ▶ In the *West Bank outside refugee camps* the perceived importance of all types of assistance is lower than average, whereas the perceived efficiency is close to the average elsewhere. The evolution since January is average both with respect to importance and effectiveness. This could mean that, proportionally to other places except Jerusalem, the needs are slightly less urgent there.
- ▶ Finally, in the *Gaza Strip outside refugee camps*, one should note an amazing increase in the perceived efficiency of education assistance. Concerning employment, it was rated specially important also in the West Bank refugee camps. In addition, the efficiency of this type of assistance, although very low as everywhere else, has witnessed a significant increase.

*Refugees* viewed health (74%), education (70%) and food (60%) as more important than non-refugees (respectively 67%, 63% and 54%). Refugees also perceived health assistance (53%) and food aid (26%) as more efficient than non refugees (47% and 20%).

*Women* viewed food (60%) and infrastructure (47%) as slightly more important than men (respectively 54% and 41%). They had the same opinion as men concerning efficiency except for infrastructure which they viewed as being slightly more effective (13% versus 9% for men).

Although *age differences* are hard to interpret, one can note that elder people gave education assistance less importance than did other age groups.

As indicated in Part III, less than 8% of Palestinians benefited from employment generation programs. When the respondents were asked whether they heard of any employment generation program, only 34% answered positively.

Interestingly, visibility seems proportionally higher in the Gaza Strip (51% in refugee camps, 46% outside camps). In the West Bank, employment generation programs are more visible inside (35%) than outside refugee camps (27%). In Jerusalem, very few people heard of any employment generation programs (12%).

Of those who said that they heard of an employment generation program, nearly one half (48%) heard of it from friends, one fifth from newspapers (20%) and from family members (19%). Finally, 8% heard of it at work, and 6% in the organizations where they work.

## PART FIVE : THE ROLE OF UNRWA

As it became clear in the previous part, UNRWA plays a major role as an assistance provider. In this part a closer focus will be provided as to UNRWA's strategies, the type of assistance it provides and its visibility, the satisfaction of its receivers and the effectiveness of the distribution it makes.

### 5.1 - UNRWA's Strategies in the past four months

Because of its relation of proximity to the Palestinian refugees and Palestinian society at large, the UN Agency is in a privileged position to sense the needs and priorities of the population it serves. Starting after one month from the beginning of the crisis, UNRWA has launched so far two emergency appeals and, in June, a third one was on the way.

The context of the second Intifada is putting a lot of pressure on the Agency's personnel and financial resources. In fact, in a document recently released by UNRWA (2001b) one can read in the introduction the preoccupation of the Agency towards the increasing number of families (of non-registered refugees) affected by the crisis that are turning to UNRWA for assistance (food, medical treatment, and relief support).

The refugees consider UNRWA as the main direct supplier of humanitarian relief. Since donors have placed their trust in UNRWA, they believe that increased demands should lead to increased emergency funding.

The Agency is willing to do its best, but within the limitations set by its financial, operational and logistical organisation. UNRWA has already shown its capacity of resilience but, as it is implied by the Agency's reports, one cannot stretch the resources indefinitely.

A quick look at the priorities set by the Agency for its second emergency appeal - which covers the period March-May 2001, and which roughly corresponds to the period under scrutiny in this report – is basic to grasp UNRWA's initiatives. In terms of total operation costs, the programs labelled as "Emergency employment creation" and "Emergency food aid" take respectively 56% and 32% of the global budget. The rest of the programs envisaged represent small amounts (they average between 2% and 5%) shared among several initiatives: Selective cash assistance for families in extreme crisis; Post-injury physical rehabilitation; Emergency medical needs; Emergency compensatory education; and Emergency monitoring and reporting services.

The priority given to Emergency employment creation also corresponds to one of the Palestinian priorities at the end of January, as was shown in the January report (Bocco, Brunner, Rabah 2001). As was shown in part three, supporting employment generation programmes was among the priorities set by the World Bank and UNDP, given the situation prevailing at the beginning of the year.

Six months later, it is rather difficult to evaluate which would be the better choice in terms of priority. If the quasi-war situation develops into a full-scale war, then food and medical aid should certainly be the priority and the money targeted for employment generation programmes should quickly be reconverted.

Looking at the overall framework of the employment generation programme, one can notice that it includes three main types of projects, aimed at creating jobs: by direct employment; by community work; and by stimulating the private-sector operations (mainly contracting constructors).

In terms of achievements projected, during the period from early March to the end of May 2001, UNRWA has planned to create 389'284 job opportunity days in the Gaza Strip and 151'324 in the West Bank at the overall cost of more than 20 million dollars. During the same period, but in terms of emergency food aid, the Agency has planned to deliver assistance to 127'500 families in the Gaza Strip and 60'000 in the West Bank, with an overall cost which amounts to almost 12 million dollars (UNRWA 2001c).

UNRWA has not received in time part of the funds pledged or requested, but has done a lot with the means at its disposal, or at least this is the impression the authors of this report had when they read the Agency's brochures and reports (UNRWA 2001a, 2001b, 2001c) or interviewed some of the organisation's personnel.

## 5.2 - Distribution of Aid

In January, 34% of the respondents stated that they did receive assistance from UNRWA. This proportion went up to 38% in June.

In the overall Palestinian population nearly four persons out of ten received assistance from UNRWA. Figure 41 shows that this varies a lot by place of residence:

- ▶ they are almost ten out of ten respondents in the Gaza Strip refugee camps that received assistance from UNRWA;
- ▶ seven out of ten in the West Bank refugee camps;
- ▶ five out of ten in the Gaza Strip outside refugee camps;
- ▶ but only two out of ten in Jerusalem and in the West Bank outside refugee camps said they received assistance from UNRWA.

Considering the evolution since January, it appears that the figure had its highest increase in Jerusalem where it raised by 8% from 14% to 22%. It is the same in the Gaza Strip refugee camps where it increased by 7% (from 88% to 95%). The increase was modest in the West Bank (4%) and small in the Gaza Strip outside refugee camps (2%).

This evolution could point to a change in UNRWA's strategy towards Jerusalem.

As shown in the graph, 78% of *refugees* said they received assistance from UNRWA. This proportion remains almost constant since January where it was 77%.

*Area of residence* too plays an important role: While 88% of respondents living in camps stated they received assistance from UNRWA (83% in January); only 39% stated so in cities and villages.

Since January, UNRWA aid seems to have been increased more in cities (+7%) than in villages (+4%).

### 5.3 - Types of assistance provided

As mentioned earlier, the respondents who said they received assistance were asked about the source and the nature of its two main types. 764 of the respondents receiving assistance said that it originated from UNRWA. Three quarters of this assistance is food, 18% financial and 7% is other non-financial.

#### Food assistance

We saw in Part III that roughly 40% of all Palestinians receive food assistance and that 45% of it comes from UNRWA. Nearly one Palestinian out of five receives food aid from this organization.

According to *place of residence*, more than half of the respondents get food help from UNRWA in the Gaza Strip refugee camps. Around 34% of West Bank camp dwellers and Gazans outside camps benefit from it but only 5% of those who live outside camps in the West Bank. In Jerusalem, no one said to have received food aid from UNRWA.

If four people out of ten get food aid from UNRWA among the refugees, only 1% do in the remaining population.

In refugee camps, nearly one half of the people (47%) benefit from UNRWA food aid. In cities, this figure sinks to 20%, while it is only 4% in villages.

#### Financial assistance

One sixth of the Palestinian population declared having received financial aid. Only 3% received it from UNRWA. It must be noted that only 1% received this type of aid in January.

According to place of residence, UNRWA seems to target its financial assistance mainly towards the West Bank (8% in camps and 4% outside; in the Gaza Strip less than 1% in refugee camps and virtually inexistent outside; in Jerusalem it is also virtually non-existent).

5% of refugees received financial aid from UNRWA, while non-refugees did not receive it.

In refugee camps, 4% received financial aid from UNRWA, compared to 3% who received such aid in cities, and 2% who received it in villages.

#### Employment generation

As indicated in section 3.4, only 8% from the total population declared having had help to find a job. Of those 90 cases, only 6% received it from UNRWA. No analysis can be made here.

## 5.4 - Satisfaction

Satisfaction with UNRWA services can be measured in two ways: either by looking at the answers to question 50 where those who said having received aid from UNRWA had to state their satisfaction, or by looking directly at the satisfaction according to services that were delivered by UNRWA. Both ways will be explored here.

First, if the general level of satisfaction with UNRWA is considered - as asked in question 50 - it remains rather positive. Over 60% of those who said that they have benefited from UNRWA's assistance evaluated the organization either very satisfactorily or satisfactorily.

This satisfaction is stronger in the Gaza Strip than it is in the West Bank and Jerusalem. Whereas 67% of the Gaza Strip's beneficiaries evaluated UNRWA positively, the positive evaluation by the West Bank beneficiaries did not exceed 49%.

Figure 48 - Satisfaction with UNRWA (O50) by place

Considering satisfaction in relation to concrete types of assistance, one can remark a sharp increase in satisfaction pertaining to food:

- ▶ In January 41% of UNRWA food beneficiaries were satisfied or very satisfied.
- ▶ In June this figure went up by 13% to reach 54%.

In the Gaza Strip, satisfaction is highest outside camps (66%). Inside camps slightly more than half of the people (52%) are satisfied and in the West Bank camps slightly less (46%). In the West Bank outside of refugee camps and in Jerusalem there were too few beneficiaries to draw any conclusion.

It may be interesting to note that specific satisfactions seem lower than the satisfaction in general.

## 5.5 - UNRWA's monitoring and reporting services

Between the end of March and April, the Agency has launched the "Operations Support Officers Programme" (OSOP), with the primary intent to reinforce the UNRWA's existing monitoring procedures and additionally to send a signal to the refugees that the Agency is both sensitive and responsive to their needs in times of crisis<sup>28</sup>. The cost for the programme has been budgeted to less than 350'000 US\$. UNRWA has also been stressing that it will be doing all it can to overcome the difficulties caused as a result of the present situation.

A group of international Operations Support Officers, seconded by a number of local assistants and organized in teams, are now constituting the bulk of the programme's human resources. At the end of May 2001, the program included 3 international officers and 3 local assistants in the Gaza Strip, and 5 international officers and 5 local assistants in the West Bank. Beside their work of support for the Agency on-going operations, the OSO's teams gather data for specific projects in the field, in the areas of health, economics and social issues affecting UNRWA's client population. They implement their mandate in consultation with the relevant departments inside the Agency and programme heads in the field.

A final note has to be written concerning the difficulty of the daily work of UNRWA's civil servants in the field. In the Emergency appeal/Progress Report released by UNRWA in early June (UNRWA 2001c), one can read that, from the beginning of the Intifada the total number of employees facing difficulties has grown to almost 1800; until the end of May, more than 330 incidents involving UNRWA personnel have been registered; more than 3500 hours of work have been lost due to crisis.

---

<sup>28</sup> During the first Intifada, UNRWA set up a "Refugee Affairs Officers' Program". The RAO had a more pronounced humanitarian role in the definition of their tasks.

## ANNEX I: LIST OF EXPERTS INTERVIEWED

Mr. Khalil ABOU FOUL, General Supervisor of EMS-Gaza Strip, Palestine Red Crescent Society.

Dr. Hasan ABU LIBDEH, President, Palestinian Central Bureau of Statistics, Ramallah.

Dr. Claus ASTRUP, Economist, World Bank, West Bank and Gaza Office, Jerusalem.

Mr. Bertrand BAINVEL, Programme Officer, UNICEF, Jerusalem.

Mr. Da'ud BARAKAT, PNA, Department of Refugee Affairs, Ramallah.

Dr. Sébastien DESSUS, Country Economist, World Bank, West Bank and Gaza Office, Jerusalem.

Mr. Daniel FASNACHT, Deputy Head of Sub-Delegation, ICRC Jerusalem.

Mr. Frédéric FOURNIER, Head of Mission, ICRC Jerusalem.

Dr. Rema HAMMAMI, Director of the Women's Studies Programme, University of Bir Zeit.

Dr. Sari HANAFI, Executive Director of SHAML, Palestinian Diaspora and Refugee Studies Centre, Ramallah.

Mr. Nadim KARKUTLI, second Secretary, European Union, Representation of the European Commission (West Bank and Gaza Strip), Jerusalem.

Mr. Luis LEMA, correspondent of Le Temps, Jerusalem.

Dr. Giuseppe MASALA, WHO Health Coordinator, WHO Jerusalem.

Dr. Alex POLLOCK, UNRWA, Gaza Field Office.

Dr. Mohammed SHTAYYEH, Managing Director, PEC DAR (Palestinian Economic Council for Development and Reconstruction), Jerusalem.

Mr. Guy SIRI, Deputy Director of UNRWA Operations & Field Technical Officer, West Bank, UNRWA, West Bank Field Office, Jerusalem.

Dr. Salim TAMARI, Director of the Institute of Jerusalem Studies, Jerusalem.

## ANNEX II: FREQUENCY DISTRIBUTIONS

The table below presents the common question numbers referred to in our legends for figures and tables. The values for January and June are question numbers.

Common	January	June	Label
O01		C1	optimisim / pessimisim
O02	C1	C2	refugee or not
O03	C2		which generation
O03A	C3A		when did you become a refugee
O03B	C3B		when did your family become a refugee
O04	C4	C3	do you have a refugee card
O08	C8	C4	working or not
O09	C9	C5	occupation
O11	C11	C7	place of work
O12	C12	C8	change in the employment during the past 3-4 months
O13	C13	C9	change consequence of the current situation
O14		C10	did you try to find a job
O15		C11	willing to work only if
O16	C14	C12	no of people in household including children
O17	C15	C13	no of employed people
O18	C16	C14	no. of employed women
O19	C17	C15	household members lost their jobs in the past 3-4 months
O20	C18	C16	household members lost their job due to Intifada
O20A	C18A	C16A	used to work in the West Bank
O20B	C18B	C16B	used to work in Gaza
O20C	C18C	C16C	used to work in Jerusalem
O20D	C18D	C16D	used to work in the settlements
O20E	C18E	C16E	used to work in Israel
O21		C17	heard about any employment generation program
O22		C18	from where did you hear about them
O23		C19	anyone benefit from any of these programs
O24		C20	kind of benefit
O25		C21	source of employment program
O26		C22	receive any assistance to find a job
O27		C23	did your wage
O27A		C23A	percent
O28		C24	Israeli or Palestinian products
O29		C25	evaluate Israeli products
O30A		C26A	Flour
O30B		C26B	Sugar
O30C		C26C	Oil
O30D		C26D	Lentil
O30E		C26E	Rice
O31	C19	C27	mobility was a problem
O32	C20	C28	change in your children behavior
O33	C21	C29	effect of al-aqsa intifada on your children
O34A	C22A	C30A	relative martyred
O34A1		C30A1	relationship
O34B	C22B	C30B	relative injured
O34B1		C30B1	relationship
O34C	C22C	C30C	property damaged
O34D	C22D	C30D	tree uprooted

<b>O34E</b>	C22E	C30E	business suffered
<b>O35</b>	C23	C31	Did yo or your family receive any assistance ?
<b>O36A1</b>	C24A1	C32A	Type of assistance received
<b>O36A2</b>	C24A2	C33A	Type of assistance received
<b>O36A3</b>	C24A3		Type of assistance received
<b>O36A4</b>	C24A4		Type of assistance received
<b>O36B1</b>	C24B1	C32B	Value of assistance received
<b>O36B2</b>	C24B2	C33B	Value of assistance received
<b>O36B3</b>	C24B3		Value of assistance received
<b>O36B4</b>	C24B4		Value of assistance received
<b>O36C1</b>	C24C1	C32C	Source of assistance received
<b>O36C2</b>	C24C2	C33C	Source of assistance received
<b>O36C3</b>	C24C3		Source of assistance received
<b>O36C4</b>	C24C4		Source of assistance received
<b>O36D1</b>	C24D1	C32D	Satisfaction for the assistance received
<b>O36D2</b>	C24D2	C33D	Satisfaction for the assistance received
<b>O36D3</b>	C24D3		Satisfaction for the assistance received
<b>O36D4</b>	C24D4		Satisfaction for the assistance received
<b>O37</b>	C25	C34	Satisfaction for the assistance received
<b>O38</b>	C26	C35	you need assistance
<b>O39</b>	C27	C36	most important need
<b>O40</b>	C28	C37	money needed every month
<b>O41</b>	C29	C38	income close to that number
<b>O42</b>	C30		know of projects
<b>O43</b>	C31		what projects
<b>O44</b>		C39	keep up financially
<b>O45</b>		C40	sustain hardship
<b>O46</b>		C41	sustain hardship
<b>O47</b>		C42	daily expenses
<b>O47A</b>		C42A	percent
<b>O48</b>		C43	household expense that was reduced
<b>O49</b>	C32	C44	benefit from UNRWA
<b>O50</b>	C33	C45	satisfaction with UNRWA
<b>O51</b>	C34	C46	relief needed for your community
<b>O52A</b>	C35A	C47A	importance of education
<b>O52B</b>	C35B	C47B	importance of health
<b>O52C</b>	C35C	C47C	importance of food distribution
<b>O52D</b>	C35D	C47D	importance of employment generation
<b>O52E</b>	C35E	C47E	importance of infrastructure
<b>O53A</b>	C36A	C48A	efficiency in providing education
<b>O53B</b>	C36B	C48B	efficiency in providing health
<b>O53C</b>	C36C	C48C	efficiency in providing food distribution
<b>O53D</b>	C36D	C48D	efficiency in providing employment generation
<b>O53E</b>	C36E	C48E	efficiency in providing infrastucture
<b>O54</b>	C37		Political faction
<b>O55</b>	C38	C49	age
<b>O56</b>	C39	C50	educational level
<b>O57</b>	C40	C51	family income
<b>O58</b>	C41	C52	marital status

<b>C55</b>	2. أنثى		1. ذكر		55. الجنس			

ANNEX IV:  
COPY OF THE QUESTIONNAIRE IN ENGLISH

Hello. I am from the Jerusalem Media and Communications Center in Jerusalem. We are conducting a study about the views of the Palestinian public on issues pertaining to the Palestinian situation and the Palestinian needs during the intifada. You were randomly selected. Your answers will be included with those of others. Thus you will not be identified in any way. We would like to assure you again that the information in this questionnaire would be dealt with in strict confidence.

How many people 18 years or older live in this household?

How many of those are women?

**Number of adults in household**

**Number of women**

	One adult	Two adults	Three adults	Four +
None	Adult	Oldest	Middle aged	2 <sup>nd</sup> Oldest male
	1	3	6	10
One woman	Adult	Male/Female	Youngest male	Middle aged male
	2	4	7	11
Two women		Youngest Female	Oldest female	Oldest/youngest male
		5	8	12
Three women			Middle aged female	Middle aged female
			9	13
Four women				2 <sup>nd</sup> youngest female
				14

R5.....

	Question	Value	Code
